TELOMY

Premium website.
Built to make them feel the loop.

A build brief for a standout marketing site — the art direction, the page-by-page structure, the signature interactions and the stack — so the website reads as the category-defining product Telomy already is, not a template. It carries the positioning straight from the Feature · USP · Moat dossier.

One narrative
device → doctor → proof, scrolled

3 audiences
member · clinician · investor

Signature motion
the organ-twin & the loop, alive

Fast + accessible
sub-2s, AA, AEO-ready

Website Build Brief — art direction, IA, section copy, interaction spec & stack. Prepared 29 Oct 2026. Companion to the Telomy Feature · USP · Moat Dossier.

What this site has to do

Make a first-time visitor understand, in one scroll, that Telomy is the only platform that closes the whole health loop — and feel that it is premium, clinical-grade and alive. The site is the top of every funnel: consumer waitlist/app install, clinician & diagnostic-centre demo requests, and the investor read. It must out-class the comparison set (Superpower, Function, Oura, Whoop, OpenEvidence) on craft, not just claims.

Primary goals
① Member app install / waitlist. ② Clinician & centre "book a demo". ③ Investor credibility. One site, three clear doors.

Who it talks to
The health-curious consumer, the practising doctor / centre owner, and the investor — each needs a different lead, reachable within one click of the hero.

The feeling
Calm, exact, confident, unmistakably medical-grade. Editorial, not SaaS-generic. "A doctor you'd trust, that happens to be beautiful."

Success = the visitor can say what Telomy is in one sentence, has seen one thing no competitor can show (the organ-age twin or the signals-not-verdicts demo), and knows exactly which button is theirs.

Art direction — what makes it standout

A dark, editorial, instrument-grade aesthetic: deep ink canvas, one living accent, serif-and-grotesk typography, and motion that is the product, not decoration. Every page should look like a readout, not a brochure.

Palette

Ink #09130F · Ink-2 #10201A · Teal #2F8F6B · Glow #4FD08F · Copper #A9643A · Soft #F4F7F5

Dark ink canvas as the default; teal is the single system accent (the only colour that moves/glows); copper is the warm human counter-accent (used sparingly, for the "felt" side and warnings). Light editorial sections for reading-heavy pages.

Typography

TelomySans (brand face) for hero lines only; a refined serif (Fraunces-class) for headlines and big numbers; a grotesk (**Geist**/Inter) for reading and UI. Tight negative tracking on large serif; tabular numerals everywhere a value appears. One quiet micro-label style (uppercase, tracked).

Motion language

The **DNA double-helix loader** is the brand's motion signature — reuse its rhythm everywhere (section reveals, the loop, the twin rotation). Motion is slow, exact, confident; nothing bounces. Scroll-driven, respects *prefers-reduced-motion*, always ≥60fps. If an animation doesn't explain something, cut it.

Imagery & texture

No stock "happy people" photos. Use real product UI (the twin, the dials, the dashboards), real device shots (patch, ring), and abstract data-driven texture (ECG traces, HRV waveforms, the DNA motif) as section dividers. Grain and depth over flat gradients.

House rule: every screen should feel like a precise instrument reading in low light — the opposite of a pastel wellness app. Benchmarks for craft: Oura's product pages, Superpower's typography, Linear's motion discipline, Stripe's structure.

Information architecture

PAGE	JOB	PRIMARY CTA
Home	The whole story in one scroll; route each audience to its door	Get the app / Book a demo
The platform (consumer)	The longevity super-app: score, organ twin, labs, devices, Sinc, closed loop	Get early access
For clinicians & centres	Evidence engine, patient-grounded answers, care graph, workflows	Book a demo
Science & evidence	Models, error bars, the grade badge, guardrails — the credibility page	Read the method
Devices & therapy	ECG patch, ring, camera-HRV; Bonphul hardware closing the loop	Explore devices
Pricing	Member tiers; test menu & bundles; clinician plans	Start / Contact sales
About	Mission, India-first story, team, the honesty posture	—
Research / Blog	SEO + AEO surface; longevity, clinical evidence, India NCD	Subscribe
Legal	DPDP privacy, medical disclaimer, terms	—

Global nav: Platform Clinicians Science Devices Pricing + a two-button right side: **Get the app** (primary) and **For clinicians** (ghost). Sticky, condenses on scroll.

The homepage — section by section

01 · Hero
Headline: **"Measure your health. Act on it. Prove it worked."** Sub: the one-line positioning. Behind it, the **3D organ-age twin rotating slowly**, each organ faintly lit by its own age. Two buttons: **Get the app** / **For clinicians**.
The twin is the single most ownable visual Telomy has — it leads, and it moves.

02 · The loop (the core idea)
A scroll-driven animation of **Device** → **Data** → **AI** → **Doctor** → **Therapy** → **Re-measure** as a closing ring. "Every player owns one slice. We own the loop." This is the section that explains the whole company.

03 · Organ-age twin
Interactive: tap an organ, see its mortality-anchored biological age and what moves it. "Not one bio-age — eight, and which one is ageing fastest." The hero feature, shown live.

04 · Signals, not verdicts
A live mini-demo: a sleep score with the person's own normal band, the felt-vs-measured check-in, and two devices disagreeing shown as a range. "Your number is a signal, not a verdict." The trust pillar — and the orthosomnia-era wedge.

05 · One AI, on your own numbers
Sinc answering with cited, grounded answers — on-device + cloud. Show a real grounded answer with citations, and the **grade badge**. "Evidence you can see the grade of."

06 · For clinicians
A split band: the same evidence engine, answering the **doctor's** question on the **patient's** real data. One line, one CTA to the clinician page.

07 · Devices & therapy
Patch, ring, camera-HRV and Bonphul hardware — the loop made physical. Real device photography on ink.

08 · Built for India
The NCD stat (101M diabetic + 136M prediabetic), IFCT foods, DPDP-native, Jan-Aushadhi affordability. "Built for India, ready for the world."

09 · Proof & honesty
Published error bars, the "what we deliberately don't claim" box, validated-against-reference-device numbers. Credibility as a feature.

10 · Closing CTA. Restate the one line, the three doors (member / clinician / investor), and the DNA motif resolving. Footer with legal + DPDP.

Signature interactions — the five things people remember

1. **The living organ-age twin.** A real-time 3D model (WebGL/Three.js) where each organ glows by its age; hover/tap reveals the number and its drivers. The homepage hero and the platform page both use it. hero
2. **The closing loop.** A scroll-scrubbed SVG/canvas animation where the six stages connect into a ring as you scroll — the company's thesis, felt not read.
3. **The signals-not-verdicts demo.** An interactive score that shows a bare number, then reveals the personal band, the felt-vs-measured line, and a device-disagreement range — teaching the philosophy by letting the visitor toggle it.
4. **The grade-badge reveal.** A cited clinical answer where each citation flips to show its evidence grade — the one thing OpenEvidence/Vera don't show.
5. **The DNA through-line.** The double-helix loader motif recurs as section dividers and the page's scroll progress indicator, tying the whole site into one object.

Each must degrade gracefully: a static, captioned fallback for reduced-motion and for crawlers. Interactions explain the product — never ornament for its own sake.

Design system & components

Tokens
Colour, type scale, spacing (4px base), radius (10–28px), elevation (soft, low-contrast), motion (durations 200/400/800ms, one easing). One source of truth, shared with the app's identity so web and product feel like one brand.

Core components
Nav (sticky, condensing), hero, section-reveal wrapper, feature card, stat/KPI tile, comparison table, score-dial, grade badge, device card, pricing table, quote/testimonial, CTA band, footer, cookie/consent (DPDP-first, decline-by-default).

Content components
Evidence-citation block, "what we don't claim" note, biomarker/marker chip, organ-twin embed, loop animation embed, waitlist form, demo-request form (role-aware).

Responsive
Mobile-first; the twin and loop become tap-through stories on phone. 16px side gutter, no horizontal scroll, type that stays legible at 320px. Dark by default; a tasteful light mode for reading pages.

Build — stack, performance, discoverability

Stack
Next.js (App Router) + TypeScript + Tailwind, React Three Fiber for the twin, GSAP/Framer Motion + Lenis for scroll, hosted on Vercel. A lightweight CMS (Sanity/Contentlayer) for Research/Blog so marketing can ship without a deploy. One shared token package with the app.

Performance budget
LCP < 2.0s on 4G mobile, CLS < 0.1, JS < 200KB on first paint (twin/loop lazy-loaded below the fold, with a poster frame). 60fps on all motion. Images AVIF/WebP, responsive, lazy.

SEO + AEO
Semantic HTML, per-page metadata & Open Graph, JSON-LD (Organization, Product, FAQ, MedicalWebPage). **Answer-engine-optimised** — clean, quotable, source-cited copy so Telomy is the answer when someone asks an AI "best longevity platform in India". The Research hub is the organic surface.

Accessibility & trust
WCAG 2.2 AA: contrast, focus states, keyboard paths, reduced-motion, captioned media. DPDP-first consent (decline by default, no non-essential cookies pre-consent). Medical disclaimer on every clinical claim. Analytics: privacy-respecting (Plausible-class) + conversion events per door.

Guardrails carried from the dossier: clinical features are decision support, not directives; bio-age and scores are wellness/informational with error bars stated; prescription/hormone/peptide options are clinician-gated; market and competitor figures are analyst/company-reported and must be labelled as such. Nothing on the site should read as a medical or lifespan promise.

Build phases

1. **Foundation (week 1–2).** Tokens + component library + nav/footer + the two reading templates (Science, About). Deploy the skeleton with real copy from this brief and the dossier.
2. **Homepage + the two product pages (week 2–4).** All sections with final copy; the loop animation and the signals-not-verdicts demo. Clinician page with the demo-request flow.
3. **The twin & signature motion (week 4–6).** The live 3D organ-age twin, the grade-badge reveal, the DNA through-line. The craft layer that makes it standout — time-boxed and always with a static fallback.
4. **Pricing, Research hub, polish (week 6–7).** Pricing with the test menu/bundles, CMS-backed Research for SEO/AEO, full a11y + performance pass, analytics + consent, launch checklist.

Sequence logic: ship a credible, fast, well-written site first (phases 1–2), then layer the signature motion (phase 3) so the site is never blocked on the hardest animation. Copy is ready today — it comes straight from the dossier.

Copy bank — ready to drop in

Hero / positioning
Measure. Act. Prove.
The longevity platform with a doctor inside.
Your whole health, one loop.
Know your biological age — organ by organ. Then change it.
Your number is a signal, not a verdict.

One-liner
Telomy is the vertically integrated longevity platform where your devices, your labs and your doctor meet one AI — to measure your health, act on it, and prove it worked.

The comparison line (use once, boldly): Superpower without the clinical engine; OpenEvidence without the patient data; Oura without the doctor; Ultrahuman without the evidence. **Telomy is all of them, on one graph, India-first.**

© 2026 Telomy. Internal/confidential build brief. Pair with the Feature · USP · Moat Dossier for full feature detail and market figures. Clinical features are decision support and do not replace professional medical judgment.
