TELOMY

Brand Story & Pitch Variants

Version 1.0 · 28 September 2026 · Anshuman Kumar, Founder

Five pitch lengths for five contexts.

Say it in 10 seconds when someone asks what you do at a coffee shop. In 30 seconds when introducing yourself to an investor at a demo day. In 60 seconds on a podcast intro. In 2 minutes at a proper pitch meeting. In one written line at the top of a cold email.

All five carry the same core story — Telomy is the longevity intelligence platform that translates your body's signals into daily guidance, with a clinician in the loop — with the level of detail scaled to the time available.

The one-line written version is what to put in cold emails, website heros, and X/LinkedIn bios. Everything else is for speaking out loud.

The one-liner (written)

For cold emails, website heros, LinkedIn bios, X profile, investor introductions. 15 words. Use verbatim.

USE VERBATIM · 15 WORDS

For written contexts — the top of a cold email, a website hero, a LinkedIn bio, an X profile.

> Telomy is the longevity intelligence platform that translates your body's signals into daily guidance, with a clinician in the loop.

The 10-second elevator (spoken)

For the coffee shop, the elevator, the person at a party who asks what you do. 25-30 words. About ten seconds at natural pace.

SPOKEN · ~10 SECONDS · 28 WORDS

For a passing conversation. No jargon, no numbers. Ends on the human outcome.

> I'm building Telomy — a longevity intelligence platform. Wearable sensors, an AI companion, a real clinician in the loop. It helps people live longer, healthier lives.

The 30-second brand story (spoken)

The core of the pitch, delivered in a single breath. For demo days, investor speed-dating, first thirty seconds of any longer meeting, opening line of a podcast intro. About 70-80 words.

SPOKEN · ~30 SECONDS · 75 WORDS

For demo days, speed-dating investors, or the first minute of a longer meeting. Ends with the ask — always.

> Your body is trying to tell you something every day — through your sleep, your heart rate variability, your labs, your recovery. Almost nobody has a way to actually hear it. Telomy is the longevity intelligence platform that finally translates the signal — wearable sensors, an AI companion called Sinc, and a real clinician in the loop. We're building this in India first. The tech is locked, human trials are running. We're raising ₹1.25 crore pre-seed.

The 60-second pitch (spoken)

For podcast intros, panel introductions, and any meeting where you have a full minute before the first question. Adds market context, competitive differentiation, and traction. About 150 words.

SPOKEN · ~60 SECONDS · 155 WORDS

For podcast intros or panel spots. Namechecks two comparables that let the listener anchor the opportunity.

> Every person is born with a body that spends a lifetime trying to tell them what's wrong before it gets worse. Most of us aren't listening — because the data is fragmented across a lab test here, a wearable there, and a clinic that never sees either. Telomy is the longevity intelligence platform that fixes this. It's a wearable and AI companion that unifies your labs, your wearable streams, your imaging, your clinic sessions and your life events into one longitudinal record. An AI companion called Sinc translates the patterns into daily guidance. A real clinician signs off on anything medical. The US version of this thesis — Function Health — has raised $298M. India's closest wearable comparable — Ultrahuman — is worth $365M. Nobody has built the multi-modal, clinician-interpreted, event-tagged version. That's the wedge. We're raising ₹1.25 crore pre-seed against clear milestones to seed.

The 2-minute full pitch (spoken)

For a proper pitch meeting after the deck opens or before the deck comes out. Full narrative arc: problem, solution, why now, evidence, ask. About 300 words.

SPOKEN · ~2 MINUTES · 305 WORDS

For the room where you have real time. Full arc — problem, solution, why now, evidence, ask. Delivered slowly. Do not rush.

> I'll give you the short version. Every person is born with a body that spends a lifetime trying to tell them what's wrong before it gets worse. The data is there — your sleep, your heart rate, your labs, your inflammation markers, your recovery. But it lives in six different apps and clinics that never talk to each other. Function Health sees your labs twice a year and stops. Oura sees your ring. Levels sees your glucose. Nobody sees all of it, at the same time, tagged with what you did that day, and interpreted by someone credentialed to say what it means. Telomy is the longevity intelligence platform that closes that gap. It has three parts. The Vault: your multi-modal biological record, event-tagged. Sinc: our named AI companion that surfaces confidence-rated patterns and drafts structured N-of-1 studies — but never diagnoses. A real clinician in the loop: every lab, image and supplement recommendation is physician-signed. The timing works. The wearable market is going from five billion to twenty-one billion by 2033. Function Health has raised two hundred and ninety-eight million. Ultrahuman — the Indian precedent — is worth three hundred and sixty-five million on a similar wedge. India's DPDP privacy regime is now operational, which favours compliant players from day one. What we've already built: the platform has been in human trials since 2025. The chamber engineering is locked — full PEMF spec, three zones, thermal cutoff, adaptive therapy engine. Three patents filed. An existing wellness clinic network that becomes our launch partners. Domain telomy.com is registered. Trademark filing is queued. We're raising one point two five crore rupees pre-seed against six clear milestones to seed. Fifty pilot users. Three to five clinic partners. Regulatory opinion. Core team hired. That gets us to a seed round in twelve to eighteen months.

Delivery notes

For every version

- Say the name Telomy in the first three words. Never delay it.
- Never use the acronym-heavy version of the tagline ("multi-modal event-tagged N-of-1 biomarker platform"). Save that for the DPR.
- Name Sinc explicitly. Investors always ask about the AI — pre-empting the question builds credibility.
- Every version except the one-liner ends with the ask. If the pitch does not end with a request, the listener has no reason to reply.
- Do not say "we measure telomere length." Say "telomere-inspired longevity intelligence." This protects the regulatory position.
- Pause after "Telomy is the longevity intelligence platform." Let it land. Do not run it into the next sentence.

The words to say (never substitute)

- "Longevity intelligence platform" — the category we're creating.
- "Clinician in the loop" — the credibility moat.
- "Event-tagged" — the technical differentiator most others miss.
- "Where human biology becomes intelligent" — the positioning line. Say this at the end of every long-form pitch as your close.

Words to avoid

- "Disruptive" — investors trained to filter it out.
- "Revolutionary" — same.
- "Uber for X" — dated framing.
- "Cure", "reverse ageing", "prevent disease" — regulatory red flags.
- "AI-powered" as a standalone claim — every startup says it. Name Sinc instead.

Where human biology becomes intelligent.
