TELOMY

Website Development Guide

For designers, developers, and AI collaborators building telomy.com

Version 1.0 · 28 September 2026

The one non-negotiable rule

This website is made by humans, for humans, about human biology. It will use AI as a tool — the way a photographer uses a lens — but it will never be generated by AI. Every headline, every micro-interaction, every asymmetric decision must be the result of a human being making a choice for a reason. The reader must be able to tell.

A

Philosophy & Positioning

Before the first pixel is drawn, understand what Telomy is trying to be, who it is speaking to, and why the shape of the site itself is a marketing decision.

1. Why this site is not like the other sites

Type "longevity platform" into a search bar. Open the first ten results in ten tabs. Look at them all at once. You will notice the same seven things — a hero video of a fit person waking up, a headline promising to "unlock your potential," three benefit cards with icons, a pull-quote from a doctor, a gradient background, a comparison table, and a founder photo taken against a white wall. This is the wellness-tech aesthetic of 2020–2025 and it is now the sound of white noise. Investors scroll past it. Doctors mistrust it. Serious users forget it.

Telomy is a longevity intelligence platform being built in India in a moment when three things are true at the same time. Every wellness startup can now spin up a polished website in a weekend using AI page-builders. Consumers have learned to sense when they are reading marketing copy that no human wrote. And the category — precision longevity — is finally being taken seriously by clinicians, investors, and regulators, which means the surface of the brand has to be as serious as the science underneath it.

> **The strategic bet** *Telomy's website will be the anti-example. It will be conspicuously human-made — in the way it writes, in the way it lays out, in the way it takes a position on things instead of hedging — so that within thirty seconds a serious visitor thinks: this is not another wellness site. This is somebody's real work. That first thirty-second impression is the entire marketing budget of the launch.*

1.1 The four things this site must do

- **Convert a warm consumer visitor into a waitlist signup** with enough information that they trust us with their biology.
- **Convert a curious clinician** into a Telomy Care demo request.
- **Give a serious investor the answers to their first ten questions** before they email us asking.
- **Earn a piece in the Ken, Rest of World, or Wired** because the founder story, the science, and the design are all quotably distinctive.

If it does not do these four things, no amount of pixel polish saves it. If it does these four things, no amount of aesthetic imperfection breaks it.

2. The human-made mandate — what it actually means

The founder has stated: "I want the website to be a thought awakening, ground breaking, human centric. These days most of the websites are AI made or drafted. But I want our site to be human developed, by humans for humans." This is a design principle, not a religious rule. Some AI will be used in the build — nobody hand-types every image tag. But the perceptible surface of the site — the parts a reader sees, reads, feels, remembers — must be authored by a human with taste, opinions, and a body.

2.1 Why this matters commercially, not just philosophically

This is not sentimentality. Recent research is unambiguous. Human-written content receives 5.44 times more organic traffic than AI-generated equivalents. It holds reader attention 41 percent longer. 59 percent of consumers now worry about brands "losing the human touch," and 52 percent feel less engaged when they suspect content is AI-written. 73 percent of designers are deliberately incorporating imperfect elements in 2026 to differentiate from AI output. This is not a moral position; it is where the market is.

For a longevity brand — where the entire purchase decision is trust — the cost of feeling AI-made is higher than in any other category. A reader who suspects an AI wrote your health advice is a reader who never comes back.

2.2 The tests every page must pass

The friend test. If a smart friend of the founder read this page, would they recognise the voice, or would they say "this sounds like ChatGPT wrote it"? If they can't tell it's Telomy without seeing the logo, the copy is not distinctive enough.

The specificity test. Does every claim include a specific number, name, place, or moment that only a real human would know? "Improves your sleep" is AI. "Adds thirty-four minutes of deep sleep on average, measured over ninety nights" is human.

The opinion test. Does every meaningful section take a position that some reasonable person might disagree with? "Personalised wellness matters" is not an opinion. "Most personalised-supplement quizzes are graveyards, and we're not one" is an opinion.

The imperfection test. Is there at least one small thing on every page that a design system template would not produce — a sentence that runs unusually long, a chart that isn't the default, a photograph that isn't quite what you'd expect? AI produces the mean. Humans produce outliers.

2.3 The founder as first-person narrator

The single strongest anti-AI signal is a real human being with a name saying "I" and "we." Anshuman Kumar will be visible on this site — not as a founder photo in the About page, but as a voice that recurs. The manifesto is in his words. The journal is his essays. The changelog is his commits. The safety commitments are his signatures. The site is a founder-narrated instrument. This is the same move Levels made with Josh Clemente, that Ultrahuman made with Mohit Kumar, and that Function Health made with Jonathan Swerdlin — every serious longevity brand has a named human as its narrator.

> **The one rule that overrides all others** *If any page could have been written about any competitor by swapping the brand name, delete it and rewrite. The pages that survive that test are the ones a human made.*

3. Positioning, personality, and the voice-of-brand

3.1 Positioning statement (canonical)

> **Telomy is where human biology becomes intelligent.** *It is the longevity intelligence platform that translates your body's signals into daily guidance — with a clinician in the loop.*

Every headline, every subhead, every meta description must fit inside this positioning. If a piece of copy could describe a fitness tracker, a supplement quiz, or a telemedicine app, it is not Telomy positioning.

3.2 Brand personality — five words to design against

Attribute	What it means for copy and design
Rigorous	Every claim has a citation, a number, or a limitation. No hand-waving. No pastel science.
Warm	The reader is a person, not a market segment. The copy is in second person, and it never talks down.
Quietly confident	We do not shout. We state. Understatement over hype. If we say something is proven, it is proven.
Curious	We invite the reader into the question, not the conclusion. We show our work. We admit what we don't know.
Human	The founder has a name. The clinicians have names. The advisors have names. The bugs have names. The site is populated, not depopulated.

3.3 Voice — how Telomy sounds when it writes

The Telomy voice is closer to a longform essayist than a marketing copywriter. Long sentences and short ones deliberately mixed. Semicolons used. Em-dashes used. Occasional first-person from the founder. Occasional dry humour. Zero jargon that isn't defined the first time it's used. Numbers presented with their confidence bands and honest limits, never as certainties.

3.4 Words to use, words to avoid

Words to use	Words to avoid
longevity intelligence, signal, translate, decode, resonance, patterns	unlock, empower, revolutionise, disrupt, transform, best-in-class
your body, your biology, your baseline, your patterns, your protocol	the user, the customer, individuals, consumers, patients (unless clinical context)
measure, observe, correlate, surface, review, sign off on	detect, diagnose, cure, reverse, guarantee, promise, hack
clinician-in-the-loop, event-tagged, N-of-1, multi-modal, longitudinal	AI-powered, cutting-edge, next-generation, seamless, holistic, wellness ecosystem
"We built this because…", "We disagree with…", "We don't yet know…"	"In today's fast-paced world…", "Take your health to the next level…", "Elevate your…"
Telomere-inspired longevity intelligence	Measures your telomere length (regulatory red flag unless a telomere test ships)

3.5 The signature sentences — write these once, use forever

- Where human biology becomes intelligent.
- The body is trying to tell you something. Telomy translates.
- Not another wearable. A place all your wearables report to.
- Six data classes. One timeline. A clinician who reads it.
- Telomere-inspired. Human-signed. Actually measurable.
- Personalised, but with the receipts.
- Sinc listens all day. Your clinician has the last word.

4. The four audiences reading the same site differently

Every page must serve four readers who arrive with different questions. If a page serves only one, three others bounce.

4.1 The four readers

Reader	Arriving from	First question in their head	Bounces if...
The consumer (target: informed 30–55 y/o urban Indian, expanding to global)	Instagram creator, Google search, referral from a friend, a podcast	"What is this thing and why do I care?"	The site reads like an investor deck or a doctor's PDF
The clinician (integrative physicians, longevity doctors, wellness clinic owners)	Peer referral, LinkedIn, a conference, a search for "biomarker platform India"	"Will this add work to my practice or reduce it, and will my patients trust it?"	The site is purely consumer-facing with no /clinicians route
The investor (angels, VCs, family offices, corporate strategics)	Twitter thread, a warm intro email, a founder reference call, a comparable-company search	"Is this a real company with a real thesis, real technology, and a real founder?"	The site is fluffy, has no science page, or hides the founder
The press / analyst (tech journalists, longevity newsletters, health-tech Substack writers)	PR outreach, a founder tweet, a launch post on Show HN or Product Hunt	"Is there a quotable story here that my readers would care about?"	The site has no manifesto, no numbers, and no distinctive design worth referencing

4.2 The routing solution

The homepage speaks primarily to the consumer, with clear escape hatches into the other three worlds. A persistent top-right "For Clinicians" link. A footer link to "Investors" that leads to the DPR and a data-room request form. A footer link to "Press" that opens a downloadable kit. This is not clutter — this is respect for four different visitors who arrived for four different reasons.

4.3 Reader-specific hero variants (optional, phase 2)

Once analytics show which traffic sources send which audiences, consider three variant heroes selected at load-time by referrer: consumer default, clinician when referred from LinkedIn or clinical publications, investor when referred from Crunchbase or a private link. This is a phase-2 optimisation; ship one hero at launch.

B

Anti-AI Design Rules

The specific, tactical rules that separate a site that feels human-made from one that feels AI-generated. Print these. Tape them to the wall.

5. The specific things that scream "AI made this"

These are the fingerprints. If any three appear on a page, that page will read as AI-generated to a discerning visitor. The reference frame is Adobe's 2026 design trends research and observed patterns across ChatGPT-generated, Framer-AI-generated, and Wix-AI-generated sites.

5.1 Layout fingerprints

- **DON'T** Three-column benefit cards below the hero with an icon, a two-word title, and a one-sentence description. This is the single most templated pattern on the internet in 2025 and it now reads as "someone used ChatGPT."
- **DON'T** Perfectly symmetric hero: centred logo, centred H1, centred subhead, centred CTA button. This is what AI produces on the first prompt.
- **DON'T** Gradient backgrounds (purple-to-pink, teal-to-blue, orange-to-red). AI defaults love gradients.
- **DON'T** Rounded corners on every element with the same 12px radius. Real design systems mix radii for different element types.
- **DON'T** Every image is either a stock photo of a diverse team high-fiving, a hand holding a phone, or an abstract 3D render of glowing spheres.
- **DON'T** Every section separated by a subtle horizontal line and 96px of vertical padding. Rhythmic but bland.

5.2 Copy fingerprints

- **DON'T** Sentences that are all the same medium length (12–18 words). Real writers vary sentence length dramatically for rhythm.
- **DON'T** Clichés: "unlock your potential," "take it to the next level," "in today's fast-paced world," "seamlessly," "holistic," "cutting-edge," "revolutionary," "empowering." These are AI's comfort blanket. Every one of them is a bright red flag.
- **DON'T** Three-item lists everywhere. AI has a pathological tic for grouping ideas into threes. Some sections should be a single sentence. Some should be seven. Some should be a paragraph.
- **DON'T** Meta-language: "Our platform is designed to…", "Our mission is to…", "We are committed to…" These are placeholder sentences AI produces when it doesn't have specifics.
- **DON'T** Perfectly balanced pro/con framings, hedged verbs ("can," "may," "helps"), and absent opinions. AI is trained to avoid controversy. Humans have positions.

5.3 Visual fingerprints

- **DON'T** Everything sits inside a 12-column grid with equal gutters. Real designers break the grid deliberately.

- **DON'T** Iconography from Heroicons or Lucide, unmodified, at 24px. Every AI-generated site uses these.
- **DON'T** Illustrations in the corporate Memphis / Alegria style (round-headed characters with primary-colour backgrounds). Dead. Do not use.
- **DON'T** Testimonials in perfect uniform cards with round avatars, five stars, and blockquote marks.
- **DON'T** A "Powered by" ticker of tech logos below the fold. This says nothing about your product.

5.4 The overall smell test

If a page looks like it could have been generated in three minutes by pasting the brand brief into v0.dev or Framer AI — even if it wasn't — it fails the test. The goal is that a designer looking at this site would say "a human made deliberate choices here that a machine would not have made."

6. The specific things that signal "a human made this"

The counter-list. These are the moves — some subtle, some brash — that make the site read as authored. Use at least six of these across the site.

6.1 Layout moves

- **DO** Asymmetric hero: the H1 anchored bottom-left, the mark floating top-right, the CTA offset. Deliberate imbalance.
- **DO** A hero that is mostly negative space (60%+ empty). AI hates empty space; humans use it for emphasis.
- **DO** Text set in a real editorial column width (60–72 characters) for long passages, deliberately not stretched across the viewport.
- **DO** Bento-style panel grids with golden-ratio proportions rather than 3-equal-columns. Some panels twice as wide as others.
- **DO** One page that breaks the grid on purpose — the founder essay, or the science page — where content spills off the safe grid because the writing demands it.
- **DO** Section transitions that are not all the same. Some are hard cuts, some fade, some have a visible marginal note ("a small aside," "a fair objection") as connective tissue.

6.2 Copy moves

- **DO** Vary sentence length wildly. Follow a 40-word sentence with a five-word one. AI can't do this because it optimises for parseable, uniform prose.
- **DO** Take an unpopular position early. On the homepage, say what Telomy is not. "We are not a supplement quiz. We are not a fitness tracker. We are not another wellness app." This is unavoidable to a human writer and impossible for AI trained to hedge.
- **DO** Cite specific, non-round numbers with sources. "216 metres of AWG14 wire per Halo chamber" reads real. "Miles of copper for our chamber" reads AI.
- **DO** Include the founder's actual voice with 'I' statements at least twice on the site. "I designed this bed for me. Then it worked. Then I built a company around it."
- **DO** Say what you don't know. "We do not yet measure telomere length. We measure the biology that reflects it." Honest limitations are the strongest possible AI-avoidance signal.
- **DO** Include one deliberate line of dry humour, once. Not everywhere. Once. "Yes, we thought about the pun in the name. No, we're not sorry."

6.3 Visual moves

- **DO** Use a real photograph of the founder that isn't the LinkedIn headshot. Him working on the chamber. Him drawing on a whiteboard. Him wearing his own patch. Working hands, not corporate portrait.
- **DO** Use real product photography of the actual PEMF bed, the actual patch prototype, the actual chamber wiring — not renders. The wires have to look real.
- **DO** Custom line-drawn diagrams for the science page. Hand-inked, not vectorised. A physician's whiteboard aesthetic.
- **DO** A visible commit ticker, a changelog, a live counter of "days since last user-visible bug" — the kind of thing engineering-culture sites like Linear, Vercel, and Anthropic do.
- **DO** A blog post that is 4,000 words long and takes 22 minutes to read. Not a listicle. AI produces 900-word listicles. Humans produce essays.

- **DO** Cloud Dancer white (#F8F8F5) as the primary background. The 2026 Pantone colour, chosen deliberately for its editorial paper-white quality. Not pure white, not off-white with a warm cast — the paper of a published book.

6.4 The signature imperfections

Adobe's 2026 research shows 73 percent of premium designers are now deliberately incorporating imperfect elements. These are the moves to use, in moderation, to signal deliberate human craft:

- A wonky serif in the logotype — the E in TELOMY has bars that don't touch the spine. Custom, hand-drawn, not from a font file.
- One panel per page where the border is drawn with a slightly rough, thin line (like a fountain-pen underline) rather than a clean CSS border.
- An occasional hand-annotated arrow pointing at a data point in a chart, in the founder's actual handwriting.
- Sub-heading marginalia — a small annotation off to the side of a section like an editorial pull-quote — that admits complication ("this is contested," "more on this below").
- Micro-copy timestamps: "last edited by Anshuman, 3 October 2026, 2:14 a.m." — the residue of authorship.

C

Site Architecture

7. The sitemap and information architecture

Nineteen unique routes, organised into six top-level clusters. Every route serves a specific reader need documented in the page brief that follows.

7.1 The full sitemap

Route	Purpose	Primary reader	Ship at
/	Home — the hero, the story, the proof, the CTA	Consumer	Launch
/vault	Telomy Vault — the multi-modal record product	Consumer	Launch
/sinc	Sinc — the AI companion	Consumer + press	Launch
/halo	Telomy Halo — the adaptive recovery chamber	Consumer + press	Phase 2
/care	Telomy Care — the clinician SaaS	Clinician	Launch
/formulas	Telomy Formulas — clinician-recommended supplements	Consumer	Phase 1
/science	The evidence, protocols, N-of-1 methodology, publications	All four audiences	Launch
/manifesto	The one-page manifesto — the founder essay that anchors the brand	Press + all	Launch
/founder	The founder story — Anshuman's biography, path, why Telomy	Press + investor	Launch
/team	Team, clinicians, advisors, hire us page	All	Launch
/journal	Long-form journal — essays, teardowns, science explainers	All + SEO	Launch
/journal/[slug]	Individual essays	All + SEO	Rolling
/for-clinicians	The dedicated clinician landing page	Clinician	Launch
/for-investors	The dedicated investor page (behind soft gate — email required)	Investor	Launch
/press	Press kit, brand assets, interview log, contact	Press	Launch
/trust	DPDP compliance, safety, ethics, data-subject rights, changelog	All + regulator	Launch
/pricing	What each product costs, honest, with the	Consumer + clinician	Launch

	reasoning		
/waitlist	The signup, with what happens after you join	Consumer	Launch
/contact	How to reach us, for what, with expected response times	All	Launch
/careers	The Working at Telomy page — hiring urgencies (CTO, CMO, DPO)	Candidate	Launch
/changelog	What we shipped this week, who shipped it, why	Everyone	Launch + rolling

7.2 What is intentionally NOT on the sitemap

- A generic Blog. There is a Journal — essays, not posts. The distinction matters.
- A Resources / Downloads page. Downloads live inline where they are relevant, or in /press for kits.
- A Testimonials page. Testimonials live on the pages they support, in-context, with the person's real name and role.
- A homepage carousel of features. Feature scrolls are AI-bait.
- A cookie banner that dominates the screen. DPDP compliance handled via a subtle bottom-left tab with granular controls.

8. The navigation model

8.1 Primary navigation (top bar)

The top bar is thin, quiet, and does not follow you on scroll for the first three viewports. It reveals as a pinned bar only after the reader has scrolled past the hero section — because the hero deserves to breathe.

Position	Element	Behaviour
Top-left	TELOMY wordmark	Home link; on hover a subtle mark-reveal animation
Top-centre (four items)	Vault · Halo · Science · Journal	Four cardinal destinations; hover reveals a mini-menu with product family or content category
Top-right primary	For Clinicians (subtle, small)	The clinician escape hatch
Top-right secondary	Join waitlist (button, copper)	The primary consumer CTA

8.2 Footer navigation

The footer is dense but organised. Four columns.

Products	Company	Trust	Reach
Vault, Sinc, Halo, Care, Formulas, Band (soon), Patch (soon), Ring (soon)	Founder, Team, Careers, Journal, Manifesto, Changelog	DPDP, Safety, Ethics, Data rights, Security, Regulatory posture	Contact, Press, Investors, For clinicians, Waitlist

8.3 The moment of decision — the hero CTA

Consumer-first: the only hero CTA is Join the waitlist. Not "Buy", not "Try free", not "Book a demo", not "Learn more". The waitlist is the correct primary action for a pre-launch platform, and framing it that way signals honesty rather than sales pressure. The secondary link is Read the manifesto, small and text-only, for readers who want context before action.

8.4 Search

Ship without site search. A twenty-page launch site does not need search; it needs good architecture. Add search only once /journal has 30+ pieces.

D

Page-by-Page Briefs

Every page below has a purpose, a reader, a structure, and specific copy. The copy is not final — the designer should push back, edit, and rewrite — but the structure and voice must survive.

9. Home · /

9.1 The reader

A curious 30–55 year-old urban Indian who has heard about longevity science, tried a fitness ring or a lab test, and is looking for the platform that ties it all together. Or an international visitor who has read one thing about Telomy and is here to see if it's real.

9.2 The nine sections in order

Section 1 — The hero (100vh, dark)

- Black background (#0A0A0A). Cloud Dancer text (#F8F8F5).
- Top-left corner: the wordmark, small (24px). Top-right corner: For Clinicians (small link) and Join waitlist (copper button).
- **Centre-left, anchored 60% down the viewport: the H1.** "Your body has been trying to tell you something."
- **Subhead directly below, weight 300:** "Telomy translates."
- Bottom-right corner, faintly: the infinity-DNA mark, quietly animating (one strand traces itself over 8 seconds, on loop). This is the sole animated element in the hero.
- Centre-right, at eye level: a single interactive detail — the letter I of INTELLIGENCE animates as one of the base pairs pulses gently. This tells the visitor: someone hand-tuned this.

Section 2 — The manifesto opener (light, 100vh)

- Cloud Dancer background.
- **One long paragraph, editorial column width (68 characters), typeset in a serif (the wordmark serif — reused):** "Every person is born with a body that spends a lifetime trying to say what's wrong before it becomes something worse. Sleep quietly falls apart. Inflammation quietly rises. Recovery quietly shortens. Almost nobody hears any of it — because the signals live in a lab report you'll see next November, a ring you charge on Tuesdays, a clinic that saw you a year ago, and a supplement bottle you started because a friend swore by it. Telomy is where those signals stop being scattered and start being read."
- Bottom-right, offset from centre: a small link, "Read the manifesto →", in copper.

Section 3 — The proof strip (dark, 40vh)

- Black background.
- Five bold statements in a row, each with a small numeric anchor — no icons, just numerals and text:
- 6 data classes — labs, wearables, imaging, clinic, events, medications
- 1 timeline — event-tagged, longitudinal, private

- 1 AI companion — Sinc, named, personified, honest
- 1 clinician — signs off on anything that matters
- 0 middlemen — you own the data, always

Section 4 — The product family (light, panel grid)

- Cloud Dancer background. Eight bento panels of unequal proportion (golden-ratio grid) — Vault (big), Sinc (big), Halo (medium), Care (medium), Formulas (small), Labs (small), Band (small, marked "Soon"), Patch (small, marked "Soon").
- Each panel is a photograph or illustration — not an icon card. Vault shows a real screenshot. Sinc shows a live conversation. Halo shows the actual bed with visible wire coils.
- Each panel has one sentence, not three.

Section 5 — The founder note (light, editorial)

- **A first-person paragraph from Anshuman, with his signature at the bottom in his handwriting:** "I built the first Telomy chamber in a workshop in Noida because I wanted to lie down inside it myself. I'm still the subject of every study we run. Everything on this site — the chamber, the app, the data model, this paragraph — began because I wanted this to exist for me. I hope it becomes something you want for you."
- Founder photograph — him at the workbench, not a corporate portrait — offset to the left of the paragraph.

Section 6 — Science + honesty band (dark, 60vh)

- **H2:** "What we're not."
- **One paragraph:** "We are not a supplement quiz. We are not a fitness tracker. We are not another wellness app. We do not measure your telomere length — no consumer platform can honestly claim to yet. We do not diagnose disease. We do not replace your doctor. We are the software layer that finally makes the years of biological signals you're already producing legible to you and to the clinician who cares for you."
- **Small link:** "The science page → "

Section 7 — The clinicians who signed on

- Not testimonial cards. A single list with real photos: name, credentials, city, one line each on why they joined.
- At launch, three real names. Do not fabricate.

Section 8 — The waitlist

- **H2:** "Come with us early."
- **One paragraph:** "Telomy is opening for the first cohort of users in early 2027. If you join the waitlist, you get: onboarding at cost, a founding-user badge, a live call with Anshuman before you start, and a permanent seat at the table when the roadmap is decided."
- Single field: email. One button: Join. Below the button, small: "We'll never share your email. You can leave any time."

Section 9 — Footer

- Four columns as per §8.2. Above the footer, a single italic line: "Where human biology becomes intelligent."

10. The Product pages

Five pages — /vault, /sinc, /halo, /care, /formulas — each following the same skeleton but each with a distinctive lead visual and voice.

10.1 The shared skeleton

- Hero (dark) with the product name, a one-sentence positioning line, a live product visual.
- The 'why this exists' — a first-person paragraph.
- How it works — panel grid with real screenshots, real device photographs, real data samples.
- The evidence — clinical citations, in-house studies, honest limits.
- Pricing — what it costs, when it ships, what the money buys.
- What it does not do — the negative feature list.
- CTA — either waitlist (consumer) or demo (clinician).

10.2 /vault — the master product

- **Hero H1:** "Every signal you've ever produced, in one place, on one timeline, event-tagged."
- Lead visual: a live scrollable timeline mockup — the visitor can drag through 90 days of a real (anonymised) user's events, biomarkers, sessions.
- **The 'not' section:** "Not a fitness dashboard. Not a lab report app. Not a wellness diary. A biological record."

10.3 /sinc — the AI companion

- **Hero H1:** "Meet Sinc."
- **Subhead:** "Named, personified, honest — the companion that reads your body all day so your clinician can make better calls all year."
- Lead visual: a live chat mockup showing Sinc referencing specific biomarkers from a demo user's Vault, with citations to the underlying data points.
- **The 'not' section:** "Sinc does not diagnose. Sinc does not prescribe. Sinc does not replace your clinician. Sinc reads, correlates, and drafts."

10.4 /halo — the chamber (Phase 2)

- **Hero H1:** "Recovery, tuned by biology."
- Lead visual: high-resolution photography of the actual chamber, with an animated overlay showing the PEMF field pattern from Zones A, B, C.
- Deep-dive tab: the full engineering — 216m of wire, 3 zones, adaptive engine — for the reader who wants receipts.

10.5 /care — for clinicians

- **Hero H1:** "The clinician surface of Telomy."
- **Subhead:** "Your patients' Vault, drafted insights from Sinc, and a workflow that respects your judgement."
- Lead visual: the actual Telomy Care dashboard, populated with a demo patient panel.
- CTA: Book a demo (calendar embed).

10.6 /formulas — Phase 1

- **Hero H1:** "Supplements, because your clinician said so — not because a quiz did."
- Lead visual: the three launch formulas (Wind-Down, Calm, Recover), photographed as objects — real bottles, real light, on a real surface.
- **The 'not' section:** "We do not sell supplements from a quiz. We do not stack eight actives underdosed. We do not include melatonin (India status) or NMN (not FSSAI-listed)."

11. /science · the credibility anchor

This is the single most important page for the investor, the clinician, and the informed consumer. It is not a wall of jargon. It is the founder's showing of work.

11.1 Structure

- A one-paragraph opener from the CMO (once hired) or, at launch, from Anshuman — laying out the epistemic posture. "What we are willing to claim, what we are not, and how we test the difference."
- A section on the N-of-1 protocol design, with a diagram of the crossover structure and worked examples.
- A section on the biomarkers Telomy prioritises — HRV, sleep architecture, CRP, ApoB, HbA1c, GGT — with the reasoning for each.
- A section on the population-model references Telomy builds on (Levine PhenoAge, GrimAge, DunedinPACE), with honest notes on limits.
- A section on the Halo's clinical basis — PEMF field strengths, PBM wavelengths, CLAS parameters — with citations.
- A section on data provenance — every stat on this site links to the raw source or the internal study reference. No unlinked numbers, ever.
- A section titled "What we don't yet know" — the honest limitations, updated quarterly.

11.2 The visual language

This page breaks the grid. Long text passages in a narrow editorial column. Hand-drawn (illustrator-inked, not stock) diagrams of the protocol structures. Real spectrograms and time-series charts from the actual studies, with annotations in the founder's handwriting pointing at the interesting parts.

11.3 The single quotable line

> *"We measure what the body will honestly tell us. We do not sell things it won't."*

12. /for-clinicians · the second front door

This page exists because a clinician arriving from a peer referral or a LinkedIn post should not have to wade through consumer-focused content to figure out whether Telomy is for their practice.

12.1 Structure

- Hero: one clean statement — "A patient's biology, ready for you to interpret. In under 90 seconds per patient."
- The three-part value: unified Vault per patient, Sinc-drafted insights, protocol-authoring tools with your sign-off.
- A workflow demonstration — a 60-second video (not animated) showing a real clinician using Telomy Care.
- Compensation: how clinicians on the Telomy panel are paid, per interpretation, per patient-month, or per protocol.
- Legal and clinical guardrails — indemnity coverage, protocol templates, sign-off records, patient consent flows.
- Book a demo — real calendar, real 30-minute slot, with Anshuman or the CMO.

12.2 Voice

Different from the consumer voice. Slightly more formal. Assumes the reader knows what CRP, HRV, and HbA1c are. Does not explain concepts the clinician already owns. Respects the reader's competence.

13. /manifesto and /founder · the human core

13.1 /manifesto

One long page. No sections. No H2s. No sidebars. Just a founder essay, 1,500 to 2,500 words, that a reader could print and take on a train. Signed at the bottom, with the date it was last edited. Updated no more than twice a year.

The manifesto is not the About page. It is the piece of writing that establishes Telomy has a worldview. A press writer looking for a quotable line finds it here. A serious investor reads it in full before they take the call. A first-time consumer bookmarks it and shares it in a WhatsApp group.

13.2 The manifesto's opening (draft, to be refined by founder)

> *"I am not a doctor. I am an astrophysicist by training and a founder by choice, and I have spent five years listening to bodies through instruments — first oxygen concentrators in a pandemic, then cryotherapy chambers, then infrared saunas, then PEMF beds. Every one of those machines was a story about a signal. Something the body was doing that the person inside it could not directly hear. Telomy is what I built when I realised that the machines aren't the interesting part. The signal is."*

13.3 /founder

Separate from the manifesto. A biographical page. Where Anshuman is from (Cuttack), what he studied (astrophysics, gravitational-wave detection via pulsar timing arrays), what he did before Telomy (Oxikit, Bonphul), why longevity, why India. Includes a real photograph, not a headshot. Includes a downloadable long-form CV. Includes his email — not a form, his actual email — for people who want to reach him directly.

13.4 /team

Every person by name. Every role. Every photograph the actual person. When roles are open (CTO, CMO, DPO), the page shows those slots explicitly as "we are hiring" with a link to the careers page. Honesty about the current state of the team is a trust signal, not a weakness signal.

14. /journal · long-form content

Not a blog. A journal. The distinction is voice, length, and cadence. Blogs post twice a week. Journals publish when there is something worth saying. Telomy's journal aims for one piece every 2–3 weeks, each 2,500 to 6,000 words.

14.1 The seven categories (as tags, not sections)

- Founder essays — Anshuman's writing, first-person, unfiltered.
- Science explainers — teardowns of biomarker studies, protocol design, honest reads of contested science.
- Product teardowns — how a specific Telomy feature was built, what didn't work, what did.
- Chamber engineering — for the biohacker-technical reader who wants coil geometry and thermal calculations.
- Clinician case studies — real (anonymised) patient stories from partner clinicians, with methodology.
- Interviews — long-form conversations with people Telomy respects (longevity scientists, integrative physicians, other founders).
- Field notes — short observations, changelogs, reflections. The looser format.

14.2 Design of an individual essay

- Cloud Dancer background, generous margins, editorial serif for the body (a real serif — Source Serif, EB Garamond, or a custom-drawn one, not Times or Georgia).
- Byline with real photo, real bio.
- Estimated reading time, honestly calculated (not "3 min read" for a 4,000-word essay).
- Marginalia — sidenotes rendered in the margin at large screens, inline at small — for asides, definitions, links, and the founder's second-thoughts.
- No related-posts widget. No comment section. No share buttons cluttering the article. A single, subtle link at the end: "Discuss this on X / LinkedIn."

14.3 The launch content

Ship the site with 3 essays already published — the manifesto (moved into the journal as well), one long science piece, and one founder story. A journal with zero posts on launch day reads as fake. A journal with three careful posts reads as ongoing.

15. /trust · DPDP, safety, ethics, security

The single strongest anti-competitive signal in Indian health-tech in 2026 is a serious /trust page. India's DPDP Act is operational, penalties reach ₹250 crore, and every consumer is now DPDP-aware. Telomy will treat privacy as a feature, not a footer link.

15.1 Structure

- A one-paragraph statement: "We are a Data Fiduciary under India's DPDP Act. Here is what that means for you."
- A section on consent — how it works, how granular it is, how to revoke it, and the fact that revoking is a one-click operation.
- A section on data residency — where the servers are (ap-south-1, Mumbai), who has access, what happens if a subpoena arrives.
- A section on the audit log — the immutable record of every access to your data, exportable by you at any time.
- A section on security architecture — encryption at rest and in transit, key management, breach protocol, insurance.
- A section on AI/ML safety — what Sinc will and will not do, the human oversight guardrails, prompt-injection defences.
- A section on ethical commitments — no data sold ever, no dark patterns, no aggressive upsells, deletion is real.
- A downloadable one-page summary — the trust brief — for reader who wants the printable version.

15.2 The voice

Legal-adjacent but readable. This is not a T&C dump. It is a promise the founder is willing to sign. And at the bottom of the page, the founder's actual signature and the date.

16. /waitlist · /pricing · /contact · /careers

16.1 /waitlist

- One field: email. One button: Join. That's the whole form.
- Below the fold: "What happens next." Four honest lines. "We email you within 24 hours with a personal note. We invite you to a live 20-minute onboarding call with Anshuman before your access opens. You get founding-user pricing (locked for life). You get a permanent line to us — no ticket queue."
- Counter: "342 people ahead of you right now." (Live, not fake.)

16.2 /pricing

- Honest pricing per product, in INR (default) and USD (toggle).
- For each price, one sentence explaining what the money buys and why.
- Founding-user pricing is called out explicitly — with the honest note that it is locked for the first N users only.
- No "contact us for pricing" — the enterprise pricing is published too, because clinicians and corporates hate calling.

16.3 /contact

- Three real inboxes: hello@telomy.com (general), clinicians@telomy.com (Telomy Care), and anshuman@telomy.com (the founder, for people who need to reach him).
- Expected response times, honestly. "We reply within 24 hours on weekdays. Anshuman replies personally within 48 hours to substantive questions."
- Physical address (Noida). Phone number. GSTIN. The legal footprint made visible.

16.4 /careers

- Explicit urgency: "We are hiring a technical co-founder / CTO, a Chief Medical Officer, and a Data Protection Officer, urgently."
- For each open role, a real job description, not a template. "Here is what you'll build in the first 90 days. Here is who you'll report to. Here is what we pay in equity and cash. Here is why we haven't found the person yet."
- A section on "what it's like to work here" — honest, including the hard parts.
- The application is a personal email, not a form. Because the first 20 employees at Telomy are being hired by the founder, not by a recruiter.

E

Visual Design Language

17. Palette, typography, spacing, motion

17.1 Palette (canonical)

Two backgrounds. One primary text. Two accents. Everything else is greyscale. Restraint is the design.

Role	Hex	Name	Where
Primary dark	#0A0A0A	Ink Black	Hero backgrounds; footer; dark sections
Primary light	#F8F8F5	Cloud Dancer (Pantone 2026 CoY)	Body backgrounds; editorial pages
Primary text on light	#0A0A0A	Ink Black	All body text on light backgrounds
Primary text on dark	#F8F8F5	Cloud Dancer	All body text on dark backgrounds
Muted text	#6B7280	Graphite Grey	Secondary text; captions; metadata
Accent 1 — scientific	#1F5C4E	Teal	Charts; scientific overlays; the mark stroke
Accent 2 — human	#B8946A	Copper	The primary CTA button; highlights; annotations
Signal — safety alert	#9B2C2C	Signal Red	Sparingly, for regulatory alerts and errors only

17.2 Typography

- **Wordmark / display serif —** custom-drawn from a starting point in Cambria or a similar geometric serif. The E is signature: three floating horizontal bars, no vertical spine. The designer draws the six letters T-E-L-O-M-Y from scratch. Do not use an off-the-shelf font for the wordmark.
- **Editorial serif (body, long-form) —** Source Serif 4 (open-source, elegant) or EB Garamond (Google Fonts). For journal essays, manifesto, founder pages. This is the paper-book voice.
- **UI sans (product surfaces, forms, dashboards) —** Inter (Google Fonts). Neutral, engineered, comfortable at every size.
- **Mono (code, timestamps, technical annotations) —** JetBrains Mono or IBM Plex Mono. For the changelog, marginalia timestamps, and any technical data.
- **Handwriting —** the founder's actual handwriting, scanned, cleaned, converted into a font (Calligraphr or similar service). Used sparingly for margin annotations, signatures, and the personal touches on data-viz.

17.3 Type scale

Role	Size (desktop)	Weight	Font
H1 hero	72–96px	400	Custom display serif

H1 page	48–56px	400	Custom display serif
H2 section	32px	500	Custom display serif
H3 sub	22px	600	Inter
Body long-form	19px, 1.7 line-height	400	Source Serif 4
Body UI	16px, 1.5 line-height	400	Inter
Caption / muted	13px	400	Inter
Mono / timestamp	14px	400	JetBrains Mono
Handwritten annotation	20px	400 (irregular)	Founder handwriting

17.4 Spacing and rhythm

- Base unit: 8px. Every spacing decision snaps to multiples: 8, 16, 24, 32, 48, 64, 96, 128, 192.
- Editorial column width: 640–720px maximum for body text. Reading is a right that overrides layout preferences.
- Hero verticals: 100vh where possible on desktop, 80vh on mobile. Give the hero breathing room.
- Section padding vertical: 96–128px between sections on desktop, 64px on mobile.
- Deliberately break the rhythm once per page. One section is unusually tight or unusually loose to signal authorial choice.

17.5 Motion — the discipline of restraint

- The hero mark animation loops slowly (8-second cycle) and has one interactive detail (base-pair pulse on hover).
- Scroll-triggered fades are used only for content entering the viewport, and only at 200ms — fast enough to feel real, slow enough to notice.
- Micro-interactions on the primary CTA button: on hover, the copper deepens by 10% and the button gains 2px of vertical lift. Nothing else.
- Zero parallax scrolling. Zero cursor-follow trails. Zero animated gradient backgrounds. Zero "features scroll" carousels. These are 2018 tricks that read AI-generated in 2026.
- One page — /halo — has an interactive product tour with real motion (PEMF field visualisation animating across the chamber diagram as the user scrolls). That is the site's single motion set-piece.

18. Photography, illustration, iconography

18.1 Photography — the biggest anti-AI signal

The single fastest way to destroy the human-made mandate is stock photography. Every image on the site is either a photograph taken specifically for Telomy, a real product photograph of the actual hardware, or is not used.

- **DO** Commission a photographer for a 2-day shoot: the founder at work, the workshop and workbench, the chamber wiring in progress, real hands on prototypes, the actual clinicians in their actual clinics. Budget ₹1.5–3L for a Delhi-based editorial photographer.
- **DO** Use the deep-lit, high-contrast, quiet aesthetic of a Wired feature or a New Yorker photo essay. Not the flat, bright, uplifted aesthetic of stock wellness sites.
- **DO** Show hands. Show tools. Show the workshop. Show real people doing real work. Show the founder wearing his own patch.
- **DON'T** Use any stock photograph, ever. Even the good ones from Unsplash have been trained-on and now read as AI-adjacent.
- **DON'T** Use AI-generated images. Even the beautiful ones from Midjourney will be spotted by discerning visitors within 6 seconds.
- **DON'T** Use rendered 3D product mockups instead of real product photography. Render only what does not yet physically exist (the Band, Patch, Ring for Phase 3).

18.2 Illustration

- Hand-drawn line illustrations for the science page, inked in a physician's-whiteboard aesthetic. Commission an illustrator (Sonaksha, Somesh Kumar, or a similar Indian editorial illustrator). Budget ₹40–80k for a launch set of 12 pieces.
- The founder's own quick pen-and-ink diagrams from his notebook, scanned and cleaned. These appear in the journal essays and the founder pages. They are not polished; they are authentic.
- No corporate-Memphis illustrations. No abstract 3D spheres. No AI-generated illustrations that pretend to be hand-drawn.

18.3 Iconography

- A minimal custom icon set (12–20 icons) drawn by the designer, not sourced from Heroicons / Lucide / Phosphor. 1.5px stroke weight, no fills, rounded terminals. All in the primary teal or ink black.
- Icons are used sparingly — for navigation aids and dashboard functions only. Marketing pages use zero icons; they use type and photograph instead.

18.4 Data visualisation

- A custom chart style built on D3 or Observable Plot: thin strokes (1px), Cloud Dancer background, teal for the primary series, copper for the annotation callouts, and the founder's handwriting for the annotations themselves.
- Every chart on the site is a real chart drawn from real data — never a decorative illustration of a chart. If the data doesn't exist yet, do not fake a chart.
- Confidence intervals shown on every trend line. Because we said we would.

F

Interactive Elements & The Hero

19. The hero animation and interactive moments

19.1 The hero

The hero of the homepage is the single most important interactive moment on the site. It has to do three things in three seconds: establish the brand, establish the tone, and establish that a human being made deliberate design choices here. The proposed treatment:

- **The infinity-DNA mark** sits bottom-right of the hero at 240px width. It animates continuously: one strand traces itself over 8 seconds, then the other. On loop. The base-pair rungs pulse very subtly, one at a time, in a slow HRV-inspired rhythm (roughly 6 seconds per cycle — the same as a resting adult's respiratory rate).
- **On cursor hover over the mark,** the pulse quickens for 2 seconds — as if the mark 'noticed' the user. This is the single interactive detail that makes visitors say "wait, did the logo just respond to me?" That reaction is worth the entire hero.
- **The H1** types itself out on first load in 900ms — but never repeats. On subsequent visits, it renders instantly. A one-time introduction, not a gimmick.

19.2 The Vault timeline (on /vault)

- A live, draggable, horizontally-scrollable 90-day timeline showing an anonymised demo user's real (or realistic) journey — sleep scores, HRV, event markers, lab points, and a Sinc annotation on the pattern.
- The visitor can drag through 90 days and see the correlations. When they pause on a specific event marker, a small overlay appears with the Sinc-drafted insight for that day.
- This is the closest thing on the site to "the product itself" — it must feel like using the real thing, not a marketing animation.

19.3 The Sinc chat mockup (on /sinc)

- A conversational mockup showing a real (scripted) exchange between a user and Sinc, with Sinc's responses citing specific biomarkers from the demo Vault.
- Not a real LLM. A carefully scripted exchange, chosen to demonstrate Sinc's honesty ("I noticed this pattern — I'd want your clinician's read before changing anything").
- Typing indicator, timestamps, message hierarchy — the whole real-chat aesthetic.

19.4 The chamber field visualisation (on /halo)

- A cross-sectional cutaway diagram of the Halo chamber, drawn to scale. As the user scrolls, the PEMF field pattern for Zones A, B, and C animates across the diagram, coloured with intensity gradients (in teal only, not full-spectrum).
- Numeric readouts overlay at each stage: field strength in gauss, wire length in metres, thermal state in °C. Because we are showing our work.

19.5 The changelog live-feed

- On /changelog, a live scrollable feed of git-commit-style entries: date, committer name, one-line description, tagged category. The kind of transparency Linear and Anthropic show. It signals: engineering culture. It signals: real people shipping real things.

19.6 What is intentionally NOT interactive

- No cursor followers. No scroll-jacking. No animated backgrounds. No 3D hero scenes. No page transitions between sections.
- The default state of the site is quiet. Interaction is a reward for engagement, not a demand for attention.

G

Technical Specification

20. Stack, performance, accessibility, SEO, AI-readability

20.1 Recommended stack

Layer	Recommendation	Reason
Framework	Next.js 15 (App Router) + React 19	Best SSR/ISR balance for content-heavy sites; supports streaming; strongest ecosystem
Language	TypeScript strict	Non-negotiable for a durable codebase
Styling	Tailwind CSS 4 + CSS variables for the token system	Fastest iteration; keeps design system explicit; no runtime CSS-in-JS overhead
Content	Sanity or Contentful (headless CMS) for /journal; MDX for manifesto, founder, and pages that need embedded components	Non-technical team can edit copy; MDX lets the designer embed interactive components inline
Animation	Framer Motion (or Motion One for smaller bundle) for React; Lottie only for the mark	Declarative motion; small bundle; SSR-friendly
Charts	Observable Plot or D3 v7	Editorial-grade; not a chart library that looks like a chart library
Icons	Custom SVG set (in-repo)	Anti-AI: no Heroicons/Lucide look
Forms / waitlist	React Hook Form + Zod validation; ConvertKit or Loops as ESP	Fast; type-safe; email deliverability matters
Analytics	Plausible (privacy-first) or Fathom, not Google Analytics	DPDP-friendly; no cookie banner needed for basic analytics; the ethical choice
Hosting	Vercel or Cloudflare Pages	Edge network; Indian POPs; automatic image optimisation
Media / CDN	Cloudinary or Cloudflare Images for photography	Automatic responsive sizing; AVIF/WebP delivery
Search (later)	Algolia or Meilisearch	Once /journal has 30+ pieces
A/B testing (later)	Vercel Edge Config + custom	Only after launch; no third-party pixels on launch

20.2 Performance targets (non-negotiable)

- **Lighthouse Performance:** ≥ 95 on mobile, ≥ 98 on desktop, at launch.
- **Largest Contentful Paint (LCP):** ≤ 1.5s on mobile 4G, ≤ 800ms on desktop broadband.
- **Cumulative Layout Shift (CLS):** < 0.05 across all pages.
- **Total JavaScript bundle:** ≤ 150 KB gzipped on the homepage; ≤ 100 KB on content pages.
- **Total page weight:** ≤ 1.5 MB on the homepage including hero imagery.

- Fonts served from self-hosted CDN with font-display: swap and subsetting. No FOIT.
- Images served in AVIF with WebP fallback, correctly sized via <picture> or Next.js Image.
- No third-party scripts on launch except Plausible and the ESP form embed.

20.3 Accessibility (WCAG 2.2 AA minimum)

- Every image has meaningful alt text ("the chamber with visible copper Zone A coils, mid-assembly" — not "chamber").
- Contrast ratios: minimum 4.5:1 for body text, 7:1 for the primary CTA. Test Cloud Dancer on ink and adjust as needed.
- Keyboard navigation works on every interactive element; focus rings visible (in copper).
- The hero animation respects prefers-reduced-motion; the mark holds static for readers with vestibular sensitivity.
- Every form has associated labels, error messages, and hint text; no placeholder-as-label.
- Semantic HTML throughout — <article>, <section>, <nav>, <main>, <aside>. No soup.

20.4 SEO — human-made content strategy

- Every page has hand-written title tags, meta descriptions, and OpenGraph/Twitter card metadata. No auto-generated meta from headings.
- Structured data: Organization schema on homepage, MedicalWebPage schema on /science, Article schema on journal essays, BreadcrumbList site-wide.
- A real /sitemap.xml, submitted to Google Search Console and Bing Webmaster Tools on launch day.
- A real /robots.txt — permissive for search, permissive for good-faith AI crawlers (GPTBot, ClaudeBot, PerplexityBot, Google-Extended), because Telomy wants to be cited in AI answers.
- Canonical URLs on every page to prevent duplication issues.
- A /rss.xml for the journal (many longevity readers subscribe via RSS to editorial content).

20.5 AI-readability (the 2026 requirement)

A meaningful share of traffic to the site will now come via LLM answers rather than search. Telomy's site must be structured so ChatGPT, Perplexity, Claude, and Gemini can accurately cite it.

- Clean, semantic HTML that summarisers can parse. Avoid layout-only div structures.
- Every claim has a citation link — LLMs weight authoritative references heavily.
- The manifesto and /science pages are structured with clear H2 sections that map to "what is Telomy?", "how does Telomy measure X?", "what is Telomy's approach to Y?" — the questions LLMs are asked and will re-use as headers in synthesized answers.
- Publish a /llms.txt file (following the emerging Anthropic/OpenAI convention) at root, indexing the most important pages and their canonical URLs.
- Include a JSON-LD FAQPage schema on the homepage answering the ten most common questions ("What is Telomy?", "How is Telomy different from Function Health?", "Does Telomy measure telomere length?").

20.6 Security

- HTTPS everywhere, HSTS enabled, TLS 1.3+.
- Content-Security-Policy header restricting inline scripts and third-party sources.
- No secrets in client-side code. All ESP tokens on server-side API routes.

- Rate limits on the waitlist submission (5 attempts per IP per hour).
- Regular dependency updates via Dependabot; monthly security review.

H

Launch & Hype Strategy

21. How to make the launch a sensation

A website launch is a moment. If it passes without a moment, the moment does not exist. The following is a 30-day pre-launch and 30-day post-launch playbook designed to make the Telomy launch impossible for the categories that matter (Indian tech press, global longevity press, longevity Twitter, and health-tech investors) to ignore.

21.1 The four weeks before launch

Week	Move	Why
−4	Post the manifesto as a standalone essay on X and LinkedIn (from Anshuman's personal accounts). No brand mention. Just the essay. Ends with a single line: "— what I'm building."	Founder authorship earns attention that brand accounts cannot. The essay becomes the talking point.
−3	Publish a single teaser page at telomy.com/soon — just the mark, one sentence, and an email field. No product info. Curiosity is a marketing budget.	Signals launch is imminent; captures the earliest interested emails
−2	Send personalised outreach to 15 tech journalists (the Ken, Rest of World, TechCrunch India, YourStory, Inc42, Longevity.Technology, Wired Health) with an embargoed preview of the site and a 20-minute founder call slot. Do not spray-and-pray.	Serious journalists write serious pieces only when they get access before public launch
−1	Record and publish a 15-minute founder video on YouTube — Anshuman explaining Telomy in his own words, filmed in the workshop with the chamber visible. Not a demo. A statement of purpose.	Video is the highest-fidelity founder signal; YouTube search picks it up for long-tail queries

21.2 The launch day

- Site goes live at 07:00 IST — the beginning of the Indian workday, still late night in California — so the first 4 hours of traffic are Indian and the site is stable before Silicon Valley wakes up.
- Anshuman posts a launch thread on X — 8 tweets, one per key idea, each with an image (the chamber, the wiring, the mark, a chart from the science page). Ends with the manifesto link.
- Send a launch email to the waitlist (~500–1000 by then) with a personal note from Anshuman.
- The pre-briefed journalists publish (embargo lifts at 09:00 IST).
- Anshuman does 3 podcast recordings that week — India-focused (The Ken, Founder Thesis) and global (My First Million, Lex Fridman if reachable, at minimum Peter Attia's team).
- Show HN post at 15:00 IST (01:30 PST, prime HN time) with the manifesto as the link, not the homepage. HN loves essays; it distrusts brand pages.
- Product Hunt launch on the following Tuesday, timed for a slow news cycle in the category.

21.3 The four weeks after launch

- Weekly journal essays — one per week for the first four weeks, so the site rewards return visitors and shows sustained authorship.
- A weekly changelog post — "what we shipped this week" — visible on /changelog and cross-posted to the Telomy X account.
- A live 45-minute session on X Spaces or LinkedIn Live in Week 2 — Anshuman + one advisor, taking questions about the science.
- A guest essay in a respected publication (Nature Medicine's newsroom, Wired Health, The Ken) in Week 3 — with the site linked as the primary reference.
- A photo essay commissioned from a photojournalist in Week 4 — inside the Telomy workshop — placed on the journal as a visual set piece.

21.4 The metrics that indicate the launch worked

- 50,000 unique visitors in the first 30 days.
- 5,000 waitlist signups (10% conversion — high, appropriate for a considered category).
- 3 pieces of earned press coverage in tier-1 publications.
- 100+ inbound emails to hello@telomy.com from press, potential hires, clinicians, investors.
- At least one moment where Telomy trends in the longevity/health-tech corner of X.
- A citation in an LLM answer within 60 days — verifiable by asking ChatGPT and Perplexity "what is Telomy?" and getting a factual, sourced response.

22. Deliverables, timeline, budget, next steps

22.1 Design deliverables (from the designer)

Deliverable	Format	Due
High-fidelity Figma file — all 19 pages + component library + design tokens	Figma	Week 3
Custom TELOMY wordmark (drawn from scratch)	SVG + variable font file	Week 2
Custom icon set (12–20 icons)	SVG	Week 3
Custom illustrations for /science (12 pieces)	SVG + PNG	Week 4
Editorial photography brief and shot list	PDF	Week 1
Motion spec (Framer / Lottie files for the mark)	JSON + reference video	Week 3
Full brand guidelines PDF	PDF (30–40 pages)	Week 4

22.2 Engineering deliverables (from the developer)

Deliverable	Format	Due
Next.js 15 monorepo, TypeScript strict, Tailwind 4	Git repo	Week 5
19 routes built to the design spec	Deployed to staging	Week 7
Sanity / Contentful setup with journal, manifesto, changelog, and pages content types	Live CMS	Week 6
Waitlist integration with ESP	Deployed	Week 6
Performance audit — Lighthouse ≥ 95 on mobile	Report	Week 8
Accessibility audit — WCAG 2.2 AA	Report	Week 8
Analytics + monitoring + error tracking wired	Deployed	Week 8
Launch readiness review with founder	Meeting	Week 8

22.3 Content deliverables (from the founder + writer)

- Manifesto essay — 1,500–2,500 words — Anshuman writes; a writer edits.
- Founder story page — 800–1,200 words — same.
- Three launch journal essays: one science, one founder, one product.
- All page copy per this guide — Anshuman drafts, writer edits, both sign off.
- Real photography shoot with the photographer — 2 days, edit 1 week later.
- Founder video for YouTube — 1-day shoot + 1 week edit.

22.4 Timeline (from designer kickoff to launch)

Weeks	Phase	Owner
1–2	Discovery + wordmark + brand guidelines + photography shoot planned	Designer + founder

3–4	Full Figma design of all 19 routes + illustrations + icons + photo shoot	Designer + photographer
5–6	Engineering build + CMS setup + content loading	Developer + writer
7	QA, performance, accessibility, cross-browser, cross-device	Developer + designer
8	Pre-launch outreach + press briefings + waitlist warming	Founder
Week 9 — LAUNCH	Site goes live at 07:00 IST	All

Total: 8 weeks from kickoff to launch. Aggressive but doable for a team that stays disciplined.

22.5 Budget guidance (INR)

Line item	Range	Notes
Designer (senior, brand + UI + illustration)	₹4,00,000 – ₹8,00,000	Codesign / Turmeric / independent senior; 8-week engagement
Developer (Next.js / senior frontend)	₹5,00,000 – ₹10,00,000	8-week engagement; part-time OK if senior
Writer / editor (long-form + copy)	₹1,00,000 – ₹2,50,000	Founder writes, editor polishes
Editorial photographer (2-day shoot + edit)	₹1,50,000 – ₹3,00,000	Delhi-based; portrait + workshop + product
Illustrator (science page set)	₹40,000 – ₹80,000	12 pieces
Video / cinematographer (founder film)	₹1,00,000 – ₹2,50,000	1-day shoot + 1-week edit
Photography / video licensing (background music, stock)	₹20,000 – ₹50,000	Minimal — most content is original
Hosting + tools (Vercel Pro, Sanity, Cloudinary, Plausible, Loops) — first year	₹1,00,000 – ₹2,00,000	Annualised
Press outreach + PR support (optional, week −4 to +4)	₹1,50,000 – ₹4,00,000	Freelance PR consultant or in-house
Contingency (10%)	₹1,50,000 – ₹3,00,000	Always
TOTAL RANGE	₹17,10,000 – ₹36,30,000	≈ $20K – $43K for a serious launch

The middle of this range (~₹25L) is the honest budget for a launch that matches the site's ambition. Anything less and one of the components suffers (usually the photography, which is the biggest anti-AI signal).

22.6 The three immediate next steps

- **1. Approve this brief.** Or push back on specific sections. Nothing below happens until the direction is locked.
- **2. Brief three designers in parallel.** Codesign (Mumbai), Turmeric Design (Bangalore), and an independent senior via Behance. Give each the same brief and ask for a 3-page response including their interpretation of the hero. Choose the one whose interpretation feels most Telomy, not most polished.
- **3. Book the editorial photographer for a 2-day shoot in Week 3.** The photography is the single biggest anti-AI signal and takes longest to organise. Book before the designer starts wireframing.

22.7 The one line to leave every reader with

> *"This site is being built by a human being with a name, in a workshop in Noida, for other human beings who want their own biology to be legible to them. That is the entire brief."*

Where human biology becomes intelligent.
