TELOMY

The ten things Telomy does that nobody else does.

Pressure-tested against: Oura · Ultrahuman · Whoop · Apple Health · Gabit · Function Health · 150.fit · Levels · InsideTracker · Superpower · Fitbit.

The honest competitive picture in 2026. Smart ring + CGM + blood test + AI coach + supplements is now table-stakes. Oura ($1B revenue, 5M+ members) acquired Veri and partnered with Dexcom. Ultrahuman ($140M run rate, $365M valuation, 800K rings sold) has Blood Vision with 100+ biomarkers. Gabit (India, $3.7M Series A) tracks 150 markers across ring + blood + CGM + scale + supplements (Näck acquisition). 150.fit launched a doctor-led program with 141 biomarkers + genomics + a 21-ingredient longevity stack. These are serious operators and most of the obvious ideas are already shipped.

The ten USPs below survived a hostile pressure-test: each is genuinely white space, each is defensible by architecture, distribution, or capital intensity, and each is directly tied to a revenue stream a VC can model.

---

01. The Six-Stream Vault

Every competitor captures one or two data streams. Oura owns the ring. Ultrahuman stacks ring + CGM + blood. Gabit reaches four streams (ring + blood + CGM + scale). Function Health is blood-only. Telomy ingests all six on one event-tagged timeline: lab panels, wearable streams, imaging (DICOM — MRI, DEXA, CT, ultrasound), clinic session data (Halo + partner devices), user-logged life events, and medications. The Vault is the product; devices are inputs.

The moat: A data-model advantage that compounds every month new sources are added. Competitors who built as device companies would need a ground-up platform rewrite to match it.

02. Event-Tagging as the First-Class Data Model

Every other platform stores data by device: "your Oura sleep", "your lab CRP". Telomy stores by event and time — every biomarker point carries its event-window context. The user taps "I had wine" or "started magnesium" or "got the flu"; 30 days later the system shows the measurable effect across sleep, HRV, CRP, resting heart rate. This is Levels' superpower for glucose, generalised to the whole body. Nobody else has built the schema for it.

The moat: Schema-level — not a feature a competitor can bolt on in a quarter. Rebuilding the data layer breaks everything above it.

03. Sinc — the Drafts-Then-Clinician-Signs AI

Pure AI insight (Gabit One, Ultrahuman AI, Oura insights) is unregulated and legally fragile for anything medical. Pure clinician services (150.fit's 5 doctors, Function's physicians) don't scale beyond their panel. Telomy's architecture: Sinc drafts every medical-adjacent insight; a real clinician reviews and signs it before the user sees it as a recommendation. The user sees the full trail — noticed by Sinc, reviewed by Dr. [name] on [date], evidence: these three data points.

The moat: Architectural, not product. It unlocks regulatory latitude pure-AI competitors cannot access and clinical throughput pure-doctor competitors cannot reach.

04. Structured N-of-1 Supplement Studies

The DTC-quiz supplement model is a graveyard — Care/of (Bayer bought for $225M) shut down, Rootine paused its flagship. The clinician-channel model (Persona Pro) is validated but static. Telomy runs real within-subject crossover trials in-app: baseline → on → off → on, with washout periods, within-subject statistical analysis, and three honest readouts — Helped, No reliable signal, Possible negative. Clinician reviews each transition. IRB-approved template for the aggregate research.

The moat: Nobody — not Function, not Gabit, not Ultrahuman — runs structured individual-level trials. The method is the differentiator; the honesty of "no reliable signal" as a valid output is the brand.

05. Telomy Halo — the Adaptive Recovery Chamber

A proprietary flagship device nobody else can ship in 2026: 3-zone PEMF (full spec frozen — 216m AWG14 wire, 8-35G continuous / 60G boost with active cooling, 45°C firmware cutoff per zone), whole-body PBM, vibroacoustic + rocking, FIR warming, EEG + HRV + SpO_2 +

mmWave sensing, and a closed-loop adaptive engine with CLAS during slow-wave sleep (+~44% delta). Deferred to Phase 2 but engineering is locked today.

The moat: Capital-intensive hardware. Ring and CGM companies cannot ship a ₹25-40 lakh in-clinic device without a ground-up industrial programme. The Halo also produces data types (EEG, controlled multi-modal, thermal) that only Telomy's Vault interprets natively.

06. Imaging Ingest — MRI, DEXA, CT inside the Vault

Every other longevity platform treats imaging as a specialist silo you upload to a radiologist's portal. Telomy ingests DICOM files directly — your MRI from 2023, your DEXA from last year, your CT last month — parses the radiologist's note, extracts structured findings, and plots them on your timeline alongside your biomarkers and wearable streams. For the "serious" longevity user who already has imaging history, this makes the Vault the only legitimate home for it.

The moat: Nobody — not Function, not Oura, not Ultrahuman, not Gabit — ingests imaging. The DICOM pipeline is a significant engineering investment and the clinical interpretation layer requires radiology partners.

07. Telomy Care — the Clinician SaaS Layer

Gabit sells to consumers. Ultrahuman sells to consumers. 150.fit employs its own five doctors in-house. Telomy sells the platform to clinicians — a web dashboard that lets any wellness, integrative, functional-medicine or longevity clinic in India adopt the entire Vault + Sinc + Formulas workflow. Per-clinic subscription ₹10-25k/month + per-active-patient. Clinicians bring their patients onto Telomy; patients stay even if they switch clinics.

The moat: The B2B2C flywheel. Consumer-only competitors have to build this product from scratch. Doctor-employing competitors (150.fit) have hit the scaling wall by design.

08. Clinic-Network Distribution — Day-1 Enterprise Channel

Ultrahuman spent 4 years and $173M building distribution. Oura spent a decade. Gabit is still building. Telomy's founder already operates Bonphul — 50+ premium wellness-clinic installations (cryo, HBOT, PBM, PEMF, sauna) across India. These become pre-signed design-partner clinics on Day 1 of Telomy Care launch. Telomy begins with distribution Ultrahuman cannot buy at any price.

The moat: Operator leverage, not product leverage. This is the single asset no competitor can replicate — only existing wellness-equipment founders have it, and there is one.

09. DPDP-Native Architecture with Per-Purpose Consent

India's DPDP Act has been operational since November 2025 with penalties up to ₹250 crore. Every incumbent is retrofitting consent flows into products built in a privacy-permissive era. Telomy was architected after DPDP: Data Fiduciary status from Day 1, consent granular per purpose (research vs clinician access vs marketing), on-device inference by default, ABDM Consent-Manager ready, immutable 7-year audit log, 72-hour breach protocol wired.

The moat: A compounding regulatory moat. The gap only widens as DPDP enforcement tightens and as corporate buyers (insurers, hospital chains) begin requiring vendor DPIAs.

10. Telomy Labs — Open-Research Publication Engine

Every longevity brand claims science. Telomy publishes it. IRB-approved aggregate studies — N-of-1 outcomes across the user cohort, chamber field responses, sleep architecture shifts, supplement response ranges — released as preprints (bioRxiv, medRxiv) with the Telomy Labs byline. The founder's astrophysics research background and existing 3-patent portfolio establish the credibility. Over 24 months Telomy becomes an actual research institution, not a wellness brand that cites research.

The moat: Scientific credibility is the one asset marketing budgets cannot buy. Publication cadence + IRB discipline + an in-house CMO is a 2-year lead no fast-follower can shortcut.

The investor-grade summary *Of these ten, three are capital-intensive (5, 6, 8), three are architectural (1, 2, 3), two are operational-defensible (7, 9), and two compound over 24+ months (4, 10). A fast-follower would need ₹200+ crore, an in-house CMO + radiology partnerships, a rebuilt data layer, a clinic sales motion from zero, and 2 years of publication cadence to catch up on all ten. By then Telomy has the India longevity-intelligence category.*
