TELOMY

Where human biology becomes intelligent.

A longevity intelligence platform — wearable biosensors, adaptive AI, and clinician-in-the-loop decision support.

MASTER DETAILED PROJECT REPORT

1. Executive Summary

> **Telomy is the personal longevity intelligence platform — a wearable-connected, event-tagged, multi-modal biomarker system that unifies labs, imaging, wearables, clinic sessions and life events into one clinician-interpreted longitudinal record.** *The name references telomeres — the biological caps that mark cellular ageing — and reads phonetically as "tell-o-me" — the body telling you what it knows. Both meanings inform every product decision.*

It closes the gap left by every current player: Function Health tests blood twice a year but cannot see your day-to-day; Levels and Ultrahuman track one biomarker (glucose) continuously; Oura and Whoop capture wearable streams but not your lab work; and none of them are event-tagged or clinician-interpreted at the individual level.

We deliver personalised biomarker studies with a clinician in the loop, translated by an adaptive AI companion called Sinc, and monetise through three reinforcing streams — platform subscription, lab-panel + interpretation, and clinician-recommended supplements. The Telomy Halo (adaptive recovery chamber, evolution of the Bonphul PEMF bed) joins later as a proprietary halo device that only our platform interprets natively. Distribution begins through the founder's existing wellness-clinic network.

Why this wins

- **Multi-modal breadth** — labs + imaging + wearables + clinic + events + medications, in one Telomy Vault (nobody else has all six).
- **Event-tagging is the killer feature** — "what did what to me": alcohol → sleep; a supplement → CRP; a session → HRV.
- **Clinician-in-the-loop** — lab, imaging and supplement recommendations are physician-signed; the credibility category leaders (Function, InsideTracker) live by.
- **Sinc — the named AI companion** — an adaptive, event-tagged interpretive layer that translates biosignals into daily guidance. Named, personified, and never a substitute for clinician judgment on high-stakes matters.
- **Rigorous N-of-1 protocols** — structured on-off supplement studies, not casual before/after — defensible efficacy claims.
- **Clinic-network distribution** — the founder's own wellness-clinic network as launch partners, plus Telomy Care (SaaS) that lets other clinics adopt the Vault.
- **DPDP-first architecture** — India's health-data regime is now operational (₹250 cr penalties); privacy is a first-class feature, not a footnote.

Headline economics

Metric	Indicative
Telomy Vault ARPU (platform subscription)	₹4,000–8,000 / user / yr
Lab-panel + interpretation attach	₹6,000–15,000 / user / yr (add-on)
Telomy Formulas subscription	₹3,000–6,000 / user / mo
Telomy Care (clinic SaaS)	₹10,000–25,000 / clinic / mo
Telomy Halo (Phase 2 chamber)	₹25–40 lakh per unit + recurring service
Development to fundable milestones	Pre-seed ~₹1.25 cr → Seed ~₹6–8 cr → Series A ₹30–50 cr

2. Vision & Positioning

The wellness market is drowning in disconnected point-solutions: a blood-test brand here, a wearable there, a supplement subscription somewhere else, and a clinic in between — all producing data none of the others can see. Telomy is the connective tissue — the personal Vault where every stream lands, gets tagged with the events that caused it, and is interpreted by the user's clinician into an evolving, personalised protocol.

2.1 The reframe: sell precision insight, not another device

Function Health sells labs, Oura sells a ring, a supplement brand sells capsules. **Telomy sells the answer to "what is actually working for me?"** — which the user can only get by seeing every data source and every event in one place, interpreted by someone credentialed to say what it means. The Vault is the product; therapies, supplements and devices are the levers.

2.2 The user experience

- **Onboard** — connect Oura/Apple/Whoop; import first blood panel (or book via partner lab); upload existing MRI/imaging; log meds and supplements.
- **Log an event** — tap: drink, poor sleep, new supplement, workout, illness, stress, medication start.
- **See patterns** — Sinc surfaces confidence-rated correlations ("3-week pattern: HRV drops the night after alcohol").
- **Run a study** — the user starts a structured N-of-1 trial on a supplement or protocol; the app schedules on/off periods and reads out the result.
- **Clinician review** — quarterly (or on triggers) the paired clinician reviews the Vault via Telomy Care and updates the protocol; new labs booked as needed.
- **Halo sessions (Phase 2)** — in-clinic sessions in the Telomy Halo produce session-level biomarker deltas the Vault tracks longitudinally.

> ***The positioning line*** *Telomy is where human biology becomes intelligent — the only platform that unifies labs, imaging, wearables, clinic sessions and life events into one longitudinal record, translated by Sinc, interpreted by your clinician, and turned into a personalised protocol that measurably works for you.*

2.3 The name story (used consistently in messaging)

Telomy carries two meanings simultaneously. The scientific meaning references telomeres — the DNA sequence that caps every chromosome and shortens with cellular ageing, the most famous biological marker of the ageing process. The human meaning reads phonetically as "tell-o-me" — the body telling you what it knows, decoded so you can act. Marketing must position Telomy as telomere-inspired longevity intelligence, never as telomere measurement (unless a direct telomere-length testing product is added to the roadmap).

3. Market, Trends & Competitive Landscape

3.1 Category is validated and hot

Category	Size / momentum	What it means for Telomy
Biomarker/precision-wellness subscriptions (Function, InsideTracker, Superpower, OneTwenty, WHOOP Advanced Labs)	Function $365/yr, WHOOP $349/yr, OneTwenty launching Jul 2026 — the exact adjacent play	Category proven; competitive but growing; our differentiation is multi-modal + clinician + event-tagged
CGM-as-a-service (Levels, Ultrahuman)	Levels ~$300M+ val; Ultrahuman on Abbott Lingo	Software insight layer wins; sensor is commodity
Wearables / patches	$5.2B (2025) → $21.2B (2033), 19% CAGR	Integrate, don't build (in early phases); Telomy Band/Patch/Ring join at Phase 3
Wellness SaaS (Mindbody, Zenoti, Vagaro)	~$0.7B → $3.5B by 2035, ~20% CAGR	Telomy Care is the biomarker/clinical layer above booking, not a booking tool
Personalised supplements (DTC)	Care/of ($225M acq.) shut down; Rootine paused flagship Feb 2025	DTC-quiz model is a graveyard — Telomy Formulas uses clinician channel instead
India diagnostics home-collection (Redcliffe, Healthians, Tata 1mg, PathKind)	Mature, competitive infrastructure	Aggregate rather than build; margin is interpretation

3.2 Direct competitors — sharpened comparison

Player	What they do	Telomy edge
Function Health ($365/yr)	100+ biomarkers, 2×/yr, clinician notes	+ wearables, events, imaging, sessions — continuous, not twice-yearly
InsideTracker ($489+/yr)	48 markers + DNA + BioAge, longest science pedigree	+ event-tagging, session data, Telomy Halo, named AI (Sinc)
Superpower ($199/yr)	Labs + AI + prescription access (TRT/GLP-1/HRT)	+ multi-modal, + clinic-network distribution, less US-centric
OneTwenty (launching Jul 2026)	Labs + Oura/Whoop/Apple + AI + prescriptions	OneTwenty is US, no clinic network, no chamber, no event-tagging headline; Telomy is India-first and multi-modal deeper
Levels / Ultrahuman	CGM + event-tagged insight, one biomarker	Telomy does the same for the whole nervous system, not just glucose
Oura / Whoop / Apple	Wearable + coaching insights	Telomy ingests them, adds labs + events + clinician + protocol

3.3 Convergence trend (why now)

- **Wellness and medical are converging** — 2026 is the year the line gets properly blurry (CGM for non-diabetics, at-home tDCS PMA, Apple Watch BP).
- **Infrastructure beats hardware** — device data flowing into unified platforms is the winning motion; Apple Health / Google Health Connect / FHIR are the plumbing.

- **The practitioner channel is validated** — Persona pivoted from DTC to Persona Pro (400+ practitioners); Function embeds clinicians; the clinic is the trust anchor.
- **AI is the moat in wellness SaaS** — Zenoti/Mindbody are racing; Sinc is device-integrated, biomarker-native, longevity-focused AI they won't build.

4. The White Space — what nobody else does

A 2×2 makes the gap explicit: multi-modal continuity + clinician-interpreted, on the India stack. Function is clinician-interpreted but not continuous. Oura is continuous but not clinician-interpreted. Levels is continuous and event-tagged but single-biomarker. OneTwenty is closest — US-only, no clinic network, no chamber, no depth of nervous-system sensing. No one is doing all of it, on India's diagnostics + clinic infrastructure, with a halo device.

> ***The unique combination*** *Multi-modal (labs + imaging + wearables + clinic + events + meds) · clinician-interpreted · event-tagged · Sinc as adaptive AI companion · rigorous N-of-1 supplement protocols · clinic-network distribution · Telomy Halo · India-first, DPDP-native. Each element exists somewhere; the combination exists nowhere.*

5. Product Architecture — Telomy Vault

The Telomy Vault is the user's longitudinal, unified biological record. Six data classes, one timeline, one interpretation layer. It is the master product surface; every other Telomy product feeds into it or reads from it.

5.1 Data classes ingested into Telomy Vault

Data class	Source	How captured	v1 / roadmap
Wearable streams	Oura, Apple Health, Google Health Connect, Whoop, Garmin, Dexcom, Abbott Lingo	Native SDKs / FHIR / OAuth	v1
Life events	User taps in app	One-tap chips: alcohol, poor sleep, workout, illness, stress, medication start, supplement start/stop, meal	v1
Medications & supplements	User + clinician + app	Structured log with dose, timing, start/stop — the substrate for N-of-1	v1
Lab panels	Partner labs (Redcliffe, Healthians, Tata 1mg, PathKind, Vijaya)	Home-collection API / user upload of PDF (OCR + structured parse via Sinc)	v1
Imaging (MRI, DEXA, X-ray, ultrasound)	User upload (DICOM/PDF) + imaging partners	Structured import; radiology report parse; DICOM viewer	v1 upload / v2 partner integration
Clinic session data	Telomy Halo + partner-clinic devices (PBM, PEMF, sleep labs, cognitive tests)	Direct device SDK / clinic-SaaS input	v1 upload / v2 Halo native
Clinical notes & history	Clinician entries + user history	Structured EHR-lite; ABDM-compatible where relevant	v1
Genetic / omics	23andMe / MyHeritage / clinical genetic tests	User upload	v2
Environmental	Air quality, sleep environment, temp	IoT partners	v3

5.2 Data model — event-first, not device-first

Traditional health apps store data by device ("Oura sleep score", "Lab CRP"). Telomy Vault stores by event and time: every biomarker point is a timestamp with its source, and every user-logged event is a first-class object correlated with the biomarker streams around it. This is what makes "what did what to me" queryable — and what makes Sinc's interpretations tractable.

5.3 The Telomy product family

Every Telomy product carries the master brand prefix, followed by a single English descriptor. Naming rules and full architecture are in the companion Brand Architecture v1.0 document.

Product	Role	Phase
Telomy Vault	The longitudinal biological record — user's master surface	P0 (launch)
Telomy Care	Clinician-facing SaaS: patient triage, Sinc-flagged insights, decision support	P0 (launch)

Telomy Formulas	Clinician-recommended nutraceuticals (Wind-Down, Calm, Recover)	P1
Telomy Labs	R&D, clinical validation, IRB studies, publications	P1 (ongoing)
Telomy Halo	Adaptive recovery chamber (evolution of Bonphul PEMF bed) — in-clinic device that only Telomy interprets natively	P2
Telomy Band	Wristband biosensor — proprietary hardware	P3
Telomy Patch	Chest-mounted biosensor for extended metrics (ECG, HRV, respiration)	P3
Telomy Ring	Ring form factor for aesthetic-first users	P3

6. The AI & Insight Layer — Sinc

Sinc is Telomy's named AI companion. It is an adaptive, event-tagged interpretive layer that translates raw multi-modal data into confidence-rated insights, structured N-of-1 studies, and clinician decision-support drafts. Sinc is not a separate brand; it is a character within the Telomy system, referenced by name in every user-facing interaction.

6.1 Layered intelligence

Layer	Role
L1 — Ingest & normalise	Cross-device schema, unit harmonisation, outlier flagging, session-window construction
L2 — Baselines & anomalies	Personal baselines per marker, drift detection, event-window aggregations
L3 — Correlation & pattern surfacing	Event → biomarker correlations with confidence bands and never implied causation
L4 — N-of-1 study engine	Structured on/off protocols, washout periods, blinded arms where feasible, honest "insufficient signal" outputs
L5 — Clinician decision-support	Interpretation drafts, prompts, red-flag triage — clinician reviews and signs off
L6 — Population insights (research)	Anonymised, consented aggregation → preprints → the long-term data moat

6.2 Honest constraints (baked into Sinc)

- **No causation without proper study design.** Correlations are surfaced with confidence and framed as "worth investigating", never as "X causes Y".
- **No diagnostic claims.** Sinc never diagnoses; it surfaces patterns for a clinician to interpret.
- **Structured N-of-1 for supplements.** On-off-on protocol with pre-defined markers, minimum duration, washout, statistical readout — or the honest answer "no reliable signal".
- **Safety envelope outside the model.** Red-flag values (dangerous labs, vital signs, Halo contraindications) trigger deterministic clinician alerts, not model outputs.

6.3 Data pipeline & MLOps

Stage	Function	Stack
Ingest	Wearable webhooks, lab-partner APIs, user uploads (labs, DICOM), clinician entries	Python + FastAPI + async workers
Storage	Time-series per user + document store for labs/imaging	Postgres + TimescaleDB + object store
Feature store	Personal baselines, event windows, N-of-1 protocol state	Feature store + reproducible pipelines
Serving	Insight generation + N-of-1 readouts + clinician dashboards	Edge (mobile) + cloud APIs
Training	Population priors (anonymised), personal-baseline models	Batch jobs; versioned model bundles; staged rollout
Governance	Explainability, audit log, consent manager, model cards	Every recommendation traceable to inputs and version

7. Clinician-in-the-Loop Model (the credibility engine)

Every interpretation of a lab, imaging report, or supplement recommendation is physician-signed — the model Function Health and InsideTracker use, and the only defensible way to operate legally in India. Sinc drafts; the clinician signs.

Function	In-house / partner	Purpose
Chief Medical Officer / Clinical Director	In-house (co-founder or Day 1 hire)	Owns clinical policy, protocols, safety, physician onboarding
Interpreting physicians (panel)	Partner clinicians via founder's network + telemedicine hires	Sign off on lab/imaging interpretations and supplement recommendations
Clinic partners	Founder's wellness-centre network	Distribute Telomy Vault; own the ongoing patient relationship; deliver in-person care
Advisory board	MDs, sleep scientists, longevity researchers	Credibility + guidance on protocols and publications

7.1 Compliance architecture

- **Registered clinicians** — all interpreting physicians registered per NMC / NCAHP; teleconsultation compliant with the Telemedicine Practice Guidelines 2020.
- **Clinical Establishments Act** — partner clinics carry the operational compliance; Telomy is the technology partner (data fiduciary).
- **Data fiduciary status** — Telomy is a Data Fiduciary under DPDP; partner clinics are joint fiduciaries for their patients' data.
- **Insurance & liability** — professional indemnity for interpreting physicians; product liability for the platform; formal SLA with clinic partners.

8. N-of-1 Supplement Study Protocol (the defensible answer to "does it work for me?")

Casual before/after is confounded and dangerous. Structured N-of-1 crossover is the recognised method for individual causal inference (Mayo, AHRQ, Nature). Telomy runs it in-app, orchestrated by Sinc.

Element	Specification
Design	On-off-on(-off) crossover, ideally blinded (matched placebo where legal and feasible)
Duration	Minimum 4 weeks per arm (adaptogens/chronic actives) or 2 weeks (acute actives), with washout
Primary marker	Pre-registered per goal (e.g. Sleep: HRV + sleep latency + PSQI; Recover: RMSSD + subjective recovery; Inflammation: CRP)
Data sources	Wearable streams + subjective ratings + relevant lab panel at start and end
Analysis	Within-subject statistical test with confidence bands; effect size expressed in the user's own units
Readout	Three honest verdicts: Helped, No reliable signal, Possible negative — with the underlying data shown
Safety	Adverse-event capture at every check-in; clinician review at each transition
Governance	IRB-approved template for aggregate research; consented participation only

> ***Why this is a moat*** *No competitor offers structured N-of-1 supplement studies with clinician oversight, honest outcomes, and integrated purchasing. Care/of and Rootine died selling supplements from quizzes; Telomy Formulas sells them with evidence that they worked for this person.*

9. Telomy Halo — Adaptive NeuroRecovery Chamber (Phase 2)

Telomy Halo is the platform's proprietary flagship device: a closed-loop, sensor-rich, multi-modal recovery pod that the Telomy Vault interprets natively. It is deferred to Phase 2, launched only after the platform is proven — the opposite of the earlier plan, and the version investors fund. Engineering evolution of the Bonphul PEMF bed programme (fully specified in the companion Chamber Spec v4.2).

- **Modalities (Halo v1):** whole-body PBM (red/NIR), PEMF (3-zone locked spec: 8–35 G standard, 60 G boost with cooling), vibroacoustic + rocking, FIR heat + distal warming, guided breathing, molecular hydrogen (HRW).
- **Sensing:** EEG (1–4 ch), ECG/PPG, SpO_2, respiration, thermal camera, mmWave radar — all feeding the Vault.
- **Adaptive engine:** rule-based L1 + per-user bandit L2 orchestrated by Sinc; safety envelope in hardware (ESP32 + independent latch).
- **Signature program:** two-phase Sleep loop — induction (warming + rocking + breath + tVNS-lite) → CLAS at slow-wave detection (+~44% delta).
- **Positioning:** the in-clinic device that produces data (controlled multi-modal, EEG, thermal) only Telomy interprets natively — a moat, not just a product.

Full engineering details (PEMF Zones A/B/C, audio stack, PBM, power, safety) are maintained in the Chamber Spec companion (v4.2, locked). This DPR carries the strategic role only. Coil geometry, thermal limits, and electrical architecture are frozen and not to be re-derived.

10. Telomy Formulas — Precision Nutrition (Clinician-Recommended, Not DTC-Quiz)

Care/of ($225M Bayer acquisition) shut down. Rootine paused its flagship in Feb 2025. The DTC-quiz personalised-supplement graveyard is real. The surviving model is the practitioner channel — Persona pivoted to Persona Pro (400+ practitioners). Telomy Formulas ships the practitioner-channel version, powered by Vault evidence and Sinc's interpretive drafts.

Aspect	Telomy Formulas approach
Trigger	Vault evidence (deficiency in labs, biomarker response in an N-of-1 study, or clinician judgement) — never a quiz alone
Recommendation	Clinician-signed; user sees the reason ("ferritin 22, target 60", "N-of-1 showed HRV ↑6 ms")
Formulations (launch set)	3 honestly-dosed formulas: Wind-Down (Mg glycinate 200 mg + L-theanine 200 mg + glycine 3 g), Calm (theanine 200 mg + KSM-66 ashwagandha 600 mg + saffron 30 mg), Recover (creatine 3–5 g + tart cherry + omega-3 + bioavailable curcumin)
Roadmap formulas	Focus (citicoline + theanine + rhodiola + bacopa), Energy (rhodiola + tyrosine + CoQ10), Longevity (GlyNAC + omega-3 + K2/D3) — add after launch
Excluded	Melatonin (India status), NMN (not FSSAI-listed), 8–9-active blends (underdose trap), high-dose antioxidants (blunt exercise adaptation)
Manufacturing	White-label / contract-manufacture with FSSAI-licensed GMP partner — no own factory in v1; own the brand and pairing logic
Regulatory	FSS 2022 Nutraceutical Regulations; per-product FSSAI approval; "NOT FOR MEDICINAL USE"; no disease claims
Delivery	Therapy Companion Packs — sachet/capsule + electrolyte + guidance + session QR; monthly subscription

- **Why this beats the graveyard:** trigger is evidence, trust is via the clinician, distribution is via the clinic + Vault, and the manufacturing risk is on the CM partner.

11. Telomy Care — Clinic SaaS Layer

The same Vault, presented as a clinician dashboard, sold to wellness / integrative / longevity clinics as their patient-management, biomarker-tracking and protocol-authoring system. This is the practice-facing surface of Telomy.

- **Patient management** — unified profile per patient with full Vault, longitudinal trends, and clinician notes.
- **Protocol authoring** — create and track multi-modal protocols (device sessions + supplements + labs + behaviour), with Sinc drafting suggestions the clinician approves.
- **Booking + intake + consents** — lightweight; integrates with Mindbody/Zenoti where clinics already use them, not a competitor to their booking.
- **Multi-user + audit** — clinician roles, audit log, consent manager (DPDP), ABDM interoperability where relevant.
- **Revenue** — per-clinic SaaS ₹10–25k/mo; the SaaS also brings the clinic's patients into the platform, feeding the population dataset.

12. Regulatory & Claims Firewall (India-first, export-aware)

> **India's DPDP Rules are operational (Nov 13, 2025) with penalties up to ₹250 crore. Consent-Manager framework by Nov 2026; full compliance by May 2027. Health data is high-risk under DPDP. Telomy is a Data Fiduciary from day one — not a checklist item. Compliance is a founding cost, not a late chapter.**

Domain	Framework	Telomy position
Data protection	DPDP Act 2023 + Rules 2025	Data Fiduciary; consent-per-purpose; on-device default; encryption; DPO on retainer; ABDM Consent-Manager ready
Telemedicine	Telemedicine Practice Guidelines 2020	Interpreting physicians registered; consultation records; prescription rules honoured
Clinical establishments	Clinical Establishments Act	Partner clinics carry operational compliance; SLAs define joint responsibilities
Medical device	CDSCO	Telomy Halo positioned as wellness; formal opinion pre-launch; tDCS excluded; any medical claim gated through proper clearance
Nutraceuticals	FSS Health Supplements & Nutraceuticals Regs 2022	FSSAI-licensed CM partner; per-product approval; "NOT FOR MEDICINAL USE"; no disease claims for Telomy Formulas
Advertising & claims	Drugs & Magic Remedies Act; ASCI	Wellness lane only; internal claims-firewall doc; marketing review board
Trademark	IP India + USPTO + WIPO	Word mark TELOMY filed in Classes 9, 10, 42, 44 (see companion Trademark Filing Brief)
Export markets	US HIPAA / FDA wellness guidance; EU MDR/GDPR	Architecture designed for regulator-parity; formal export path a Series-A decision

12.1 Do-say / don't-say (the internal firewall)

Do say (wellness)	Do NOT say (medical)
Tracks how your body responds	Diagnoses / cures / treats disease
Surfaces patterns for you and your clinician	Detects cancer / heart disease / dementia
Personalised protocols reviewed by your clinician	AI prescribes / AI decides your treatment
Your clinician recommended this supplement	Take this to fix X (biomedical claim)
Supports relaxation / recovery / sleep readiness	Guaranteed weight loss / disease reversal / anti-ageing
Telomere-inspired longevity intelligence	Measures your telomere length (unless a direct telomere-length test is a shipped product)

13. Data Privacy & Security Architecture

Privacy-by-design is a product feature, not fine print — the only credible response to neurodata anxiety and the regulatory reality.

- **Data-fiduciary status** — Telomy registered; clinics that use Telomy Care are joint fiduciaries per patient.
- **Consent per purpose** — separate consents for platform use, clinician access, research participation, marketing; revocable any time; ABDM Consent-Manager ready.
- **On-device by default** — the personal model + Sinc's insights run locally where possible; cloud is opt-in for research or clinician access.
- **Encryption everywhere** — at rest (AES-256), in transit (TLS 1.3+); customer-managed keys for enterprise clinics; signed firmware / model bundles.
- **Least privilege + audit** — role-based access, immutable audit log, breach notification workflow (DPDP 72 h).
- **No data sale, ever** — explicit contractual commitment; aggregated research data anonymised, consented, IRB-approved.
- **Cross-border handling** — India-resident storage by default; export markets served from local regions.
- **Data-subject rights** — in-app rights portal (access, correction, deletion) meeting DPDP timelines.

14. Team, Organisation & Hiring Plan

14.1 Founding & early team

Role	Timing	Purpose
Founder / CEO (Anshuman)	In place	Product, hardware, partnerships
Technical Co-founder (consumer / health software)	Pre-seed gate	Telomy Vault app, cloud, integrations, ML
Chief Medical Officer / Clinical Director	Pre-seed gate	Owns clinical policy, physician panel, safety, protocols
Head of Compliance / Data Protection Officer	Pre-seed (fractional → full-time)	DPDP, telemed, CDSCO, FSSAI, ABDM
Founding Engineer (mobile)	Pre-seed	iOS/Android app + wearable integrations
Founding Engineer (backend / data)	Pre-seed	API, storage, pipelines, Sinc training infra

14.2 Seed-round build-out (~15–22 people)

- **Product & software** — ML lead (bio-signal + N-of-1), backend, mobile, DevOps.
- **Clinical operations** — clinical operations lead + panel of interpreting physicians (partner + in-house).
- **Formulas PM** — owns formulation, CM partner, FSSAI approvals, supplement subscription.
- **Care partnerships & GTM** — partnerships lead + BD for the Telomy Care clinic-SaaS channel.
- **Halo hardware / firmware** — skeleton team pre-Phase 2; scales up when Halo gets green-lit.

14.3 Advisors

- **Longevity / systems-biology researcher** (Snyder-adjacent credibility) — credibility + publication guidance.
- **Sleep scientist / neurologist** — protocols and safety for Halo and CLAS work.
- **Regulatory counsel** — DPDP + CDSCO + FSSAI; on retainer.
- **Consumer-health operator** — growth, retention, subscription economics.

15. Development Roadmap & Milestones

Phase (approx.)	What ships	Gate to next phase
P0 — Foundations (0–6 mo)	Telomy Vault MVP: mobile app + Oura/Apple Health + event-tagging + lab-upload/parse + clinician view; Sinc L1–L3 layers live; 3–5 partner-clinic pilot with 50 users; regulatory opinion; core hires	Retention target hit; ≥ 3 clinics paying/signed; 1 honest case study
P1 — Platform build (6–18 mo)	Add Whoop/Dexcom/Abbott + full Telomy Care dashboard + first N-of-1 protocol engine + Telomy Formulas Wind-Down launch + IRB study started + Telomy Care pilot with 10–20 clinics	Real MRR; publishable observation; supplement attach proven; SaaS retention holds
P2 — Halo (18–36 mo)	Telomy Halo launched into partner clinics as flagship; geo expansion; Sinc L4–L5 layers mature	Halo pilots; platform-only insights the Halo uniquely produces
P3 — Scale + own hardware (36+ mo)	Telomy Band / Patch / Ring launched; population-model research outputs; export-market entry	International expansion; category leadership; strategic optionality

16. Go-to-Market & Commercial Model

16.1 Segments

Segment	Why	Channel
Longevity / integrative / functional-medicine clinics	Real pain: fragmented data, no longitudinal view, want a new revenue line	Direct (founder network first), then partner BD
Premium spas & wellness centres	Signature recovery experience + measurable outcomes	Hospitality + wellness partners
Sports / performance centres	Recovery + evidence for athletes	Direct + sports-science networks
Corporates (large employers)	Executive-health programs; measurable outcomes	Enterprise sales (Phase 2)
HNI / DTC individuals	Telomy Vault as personal precision-wellness OS	Referral from partner clinics; direct after Phase 1

16.2 Revenue streams

Stream	Model	Indicative
Telomy Vault subscription (consumer)	Freemium + Pro tier	₹4k–8k / user / yr
Lab-panel + interpretation	Pass-through + interpretation fee	₹6k–15k / user / yr add-on
Telomy Formulas subscription	Clinician-recommended monthly pack	₹3k–6k / user / mo
Telomy Care (clinic SaaS)	Per-clinic subscription + per-active-patient	₹10–25k / clinic / mo
Telomy Halo (Phase 2)	Hardware sale to clinics + service SaaS	₹25–40 L / unit + ₹5–15k / mo / site
Enterprise / research (Phase 2–3)	Corporate wellness contracts; consented research licensing	Large contracts

16.3 Wedge → halo motion

The wedge is Telomy Vault + Telomy Care through the founder's network. The halo is Telomy Halo. Sequence: prove Vault retention and clinic willingness-to-pay first; sell Halo into the same clinics second; each reinforces the other's value. Telomy Band / Patch / Ring come in Phase 3 only after the software moat and clinic distribution are established — not before.

17. Financial Plan (Indicative)

Indicative shape only; every input is a lever (see companion financial model). The plan is deliberately conservative on units and aggressive on the data/moat build.

17.1 Staged raise

Round	Amount	Buys / gate
Pre-seed	~₹1.25 cr	Telomy Vault MVP + Oura/Apple + event-tagging + Sinc L1–L3 + N-of-1 dashboard + 50-user pilot + core hires + reg opinion — pre-seed gate criteria
→ GATE	—	Retention target; ≥3 clinics; 1 case study; no reg blockers
Seed	~₹6–8 cr	Multi-device platform + Telomy Care dashboard + IRB study + Telomy Formulas pilot + Care pilot + ~15-person team
→ GATE	—	MRR; publishable observation; supplement attach; SaaS retention
Series A	~₹30–50 cr	Telomy Halo launch + geo expansion + scaled team

17.2 Illustrative three-year shape

Year	Vault users	Care sites	Formulas subs	Halo units	Notes
Y1	1,500–3,000	20–40	800–1,500	0	Pilot → first commercial adoption; heavy invest
Y2	8,000–15,000	80–150	4,000–8,000	0–5	MRR emerging; supplement attach compounds; SaaS scales
Y3	30,000–60,000	250–500	15,000–30,000	20–50	Halo launches; multi-stream revenue; population dataset useful

Unit-economics anchor: Telomy Vault subscription + Telomy Formulas attach is the durable LTV engine; Telomy Halo contributes hardware GP + differentiated positioning; Telomy Care brings distribution and recurring revenue. Full model: companion .xlsx.

18. Risk Register & Mitigations

Risk	Mitigation baked into the plan
Effect / insight isn't strong enough to feel	Design-partner N-of-1 pilot in own clinics before scaling; measured outcomes
User retention (Levels churns after novelty)	Clinician loop + event-tagging + measurable-benefit reports + N-of-1 studies designed for stickiness; Sinc personality builds daily engagement
Regulatory reclassification (EEG/ECG + outcomes)	Wellness lane; reg opinion pre-freeze; tDCS excluded; clinician-signed interpretations for anything medical-adjacent
N-of-1 false signals	Structured protocols only; confidence bands; "no reliable signal" is a valid output; clinician sign-off
DPDP non-compliance (up to ₹250 cr)	Data fiduciary from day one; DPO on retainer; consent manager; on-device default; DPDP-first architecture
Personalised-supplement graveyard	Clinician channel + evidence trigger + white-label CM (no factory in v1); Persona-Pro model, not Care/of
Competitor first-mover (OneTwenty et al.)	India-first, clinic-network distribution, Telomy Halo, deeper multi-modal — US players unlikely to enter India well; we can partner or expand later
Telomere-name regulatory sensitivity	Position as telomere-inspired longevity intelligence, not telomere measurement; no product claim about telomere length unless a direct test is added
Scope creep (four-companies-at-once)	One platform, phased; anything off the roadmap is deferred
No named technical co-founder	Urgent hire: pre-seed gate. Non-negotiable
No named clinical director	Urgent hire: pre-seed gate. Non-negotiable
Working capital drag (Halo)	Halo to Phase 2; asset-light software + Care + Formulas first
Data breach	Encryption, audit, breach-response playbook, cyber-insurance, minimum-necessary data handling

19. Intellectual Property & Data Moat

- **Trade secret (primary moat)** — Sinc's personal models, the population dataset, the pairing/interpretation logic — the compounding advantage.
- **Patents (targeted)** — specific novel methods only: the two-phase induction → CLAS sequencing with our sensor set; multi-modal event-to-biomarker correlation with confidence-band decision logic; specific N-of-1 protocol structures. Broad "adaptive engine" claims won't survive prior art — don't file them.
- **Trademarks (in progress)** — word mark TELOMY filed India Classes 9, 10, 42, 44; US Paris Convention priority within 6 months; Madrid Protocol extension after India acceptance. Design marks for the identity system to follow. Full detail in companion Trademark Filing Brief v1.0.
- **Brand + clinician-network + regulatory head-start** — the near-term defensibility while the data moat matures.
- **Publications** — peer-reviewed preprints from IRB-approved Telomy Labs studies build scientific credibility competitors cannot buy with marketing.

20. Validation & Testing Plan

- **Vault pilot (P0)** — 50 users, 3–5 clinics, 12 weeks; primary: retention + qualitative usefulness; secondary: event-tagging engagement, Sinc insight-clicks, clinician-review rates.
- **N-of-1 supplement study (P1)** — pilot Wind-Down formula across 30–50 users on a proper on/off protocol; primary: within-subject sleep-onset + HRV shift with confidence bands.
- **Telomy Care pilot (P1)** — 10 clinics; primary: weekly-active-clinician + protocol-authoring rate; secondary: patient outcomes tracked over 90 days.
- **Halo closed-loop pilot (P2)** — within-subject crossover, adaptive vs fixed; primary: HRV shift and sleep-onset latency; safety endpoints.
- **Ongoing** — continuous safety monitoring, adverse-event tracking, quarterly clinical & data-privacy audits, annual regulatory review.

21. The Next 90 Days

Recruit the technical co-founder (shipped consumer/health software) and lock the Clinical Director (both are pre-seed gates).

1. Recruit the technical co-founder (shipped consumer/health software) and lock the Clinical Director (both are pre-seed gates).

2. Obtain a written regulatory opinion (DPDP + CDSCO + FSSAI + telemedicine) and freeze the claims firewall.

3. Confirm applicant entity for the TELOMY trademark and file India word-mark applications in Classes 9, 10, 42, 44 within 7 days (see companion Trademark Filing Brief).

4. Commission the brand identity system from a designer (Codesign / Turmeric Design / Elephant Design or equivalent); target 4-6 weeks (see companion Brand Identity Brief).

5. Sign 3–5 design-partner clinics from the existing network; draft data-sharing + joint-fiduciary agreements.

6. Ship the Telomy Vault MVP scaffold: event-tagging + Oura or Apple Health integration + lab PDF upload/parse + clinician view; Sinc L1–L3 online.

7. Onboard the first 50 pilot users; measure retention, engagement, clinician-review rate; log every issue.

8. Stand up DPO retainer + consent-manager scaffolding; publish the privacy policy that reads like a product feature.

9. Raise the small pre-seed against these milestones — not against the full vision.

> *Founders who volunteer their biggest risks and show the cheapest path to killing them get funded. Everything after this DPR is execution.*

22. Closing

Telomy creates a category rather than joins one. Function Health tests you twice a year and stops. Levels tracks one biomarker. Oura watches your recovery. None of them know what you did, what your labs say, what your clinician thinks, and what protocol actually works for you — in one place, over time. Telomy does. It is the personal Vault, the clinician's longitudinal view via Telomy Care, the honest supplement laboratory via Telomy Formulas, and the Telomy Halo's data home — with Sinc as the AI companion who translates all of it into daily guidance.

Executed with discipline — clinician-in-the-loop from day one, DPDP-first architecture, honest N-of-1 protocols, white-label supplements through the clinician channel, telomere-inspired positioning without medical overclaim, and Halo deferred to Phase 2 as a halo device — it is buildable, defensible and fundable. The alternative — four parallel companies competing head-on with Care/of, Dexcom and Function — is the version that runs out of focus and money.

The name is chosen (Telomy). The domain is registered (telomy.com). The trademark filing is queued (Classes 9, 10, 42, 44). The brand architecture is locked (Vault, Care, Formulas, Labs, Halo, Band, Patch, Ring, with Sinc as the AI companion). The technical engineering for Halo is locked (Chamber Spec v4.2). The next 90 days are execution, not decision.

Where human biology becomes intelligent.
